I keep reading about using the software to program the radio but what if you have to do it manually? I'm not finding much information on the group about that. Like what each menu feature does or how to program this or that. I have figured a lot out with youtube videos but the one thing I can't seem to figure out is how to alpha tag my memories.?.? Can anyone help with this?

thanks and 73,
Jamie R. Dean - K4RIT

I believe Alpha tag memories can only be done via software program.

I tried it, it works as "advertised" :)
Haven't had the time to test the new expanded range thou.

I gave my rtl-sdr to a friend, when I get it back I will try the expanded tx.

I get it that people are scared of viruses etc, but if you are that
cautious just install the software under a virtual machine.

> I still haven't used the software. There's probably nothing wrong >with it, but to me an admittedly hacked software from someone I don't >know, that apparently disappeared as quickly as he appeared, deserves >some measure of caution. Has anyone taken a chance and tried this?

There is some power reflected with a mismatch. However, the loss from
that is dwarfed by using a better cable.

A 1.5:1 mismatch causes a 4% loss in power. At most.

RG6 has about HALF the loss of RG8X at 440. (4.3 vs 7.9 dB/100ft)

So, anything more than several feet would have less loss with the RG6.
(Plus, RG6 is cheaper than RG8X.)

all this discussion assumes that the antenna has a 1:1 match on the frequencies you are operating on.
the 75 ohm coax will have a 1.5:1 miss match right at the radio to begin with. Any antenna miss match will be added on top of that 1.5:1 cable miss match.
So, if your antenna has a 1.5:1 swr, your now at 2:1 swr to the radio...this is within the operating parameters of most HT's, but you are already dealing with a relatively low power transmitter. And, likely, some kind of unity gain or low gain type of antenna. I'm not sure why one would really compremise a few cents a foot for 75 ohm cable, if one can use LMR400 or RG214 and get the same or better result on just cable specs, and have a proper 50ohm feed line.
75 ohm coax can be useful in many feedline and impedance/antenna matching applications, but using it as your main feedline connected to a 50ohm transceiver seems to be counter productive to say the least.
Ok, the RG6 has better specs on UHF over a 100FT run. But you are eating up any improvement by feeding a 50Ohm transceiver and an antenna with a 50ohm feedpoint impedance...with a minimum of 1.5:1 SWR no matter how well you tune the antenna.
Spend the extra couple bucks and get 50ohm low loss cable...it's not hard to find and it's not overly expensive.
or, better yet, and this is just for the sake of the discussion, use 450 ohm latter line to feed the antenna and use low loss 4:1 baluns on the radio and antenna ends. latter line has the least amount of loss up to UHF frequencies compared to any coax type of feedline. Even with a pair of low loss baluns in the feedline, you'll still get better power transfer out to the antenna from your 5W HT.
this isn't a feesible solution for most installations though and I understand that.
if we're talking about short runs, then an extra 20 cents a foot isn't going to break the bank and it will improve performance significantly over a 75 ohm feedline.
there are lots of reputable cable sellers online, and they will even sell you custom lengths of cable with your choice of connecters.
Remember, your going to get signal loss through adapters and stuff as well...a typical SMA F connecter to so239/UHF female is going to probably give you 1 or 2 DB loss...which isn't really that much, but add that to the 2 or 3 db loss from using the wrong impedance cable, plus any losses incurred by the feedline length, and any losses from the swr of the antenna, and suddenly, you are up to 6 or 7DB on UHF which is more than an S unit in practical terms.
that can be the difference between readability and non-readability on both rx and tx.
It's like using 2 inch water line, then reducing it down to half inch and then back to two inch and expecting the same water volume and flow as with a

2 inch pipe all the way through.

there are many ways to skin the cat when it comes to antennas and feedlines,
but you always try to maximize your signal transfer to the antenna and using
75 ohm coaxwith a 50ohm transceiver and a 50ohm antenna doesn't do this.
about the only time 75 ohm coax plays well using a standard 50ohm
transceiver is when you are connecting to a half wave dipole...the feedpoint
impedance on a typical horrizontal half wave dipole is around 73 ohms, so
the 75 ohm coax matches well and reduces the slightly higher impedance at
the radio that 50ohm coax would present using that type of antenna.
most commercially availible VHF/UHf antennas are designed for a 50Ohm
feedpoint impedance.
Anyway, I've beat this dead horse enough hi hi.
just my quarters worth on the subject.

If you're using RG6 for feedline and are worried about SWR, my recent research via Google on the matter says go for it. Just make sure the line is cut to a 1/2 wavelength. If you're looking at 145 MHz that's 3.3931 ft or 40.7172 inches. I've found a few calculators online that will find the length out to 15 decimal points.
Apparently at 1/2 wavelength coax lengths it doesn't matter that it's 75 ohms, if the antenna and HT are both 50 ohms the line looks like 50.
Don't ask me how it works because I have no clue. Just Google anything about RG6 and ham radio and there's plenty out there showing even not worrying about the correct length is worth it, from a cost and dB loss standpoint.

Awrite.....I've read this manual at least 72 times and followed the instructions just as often, looked at the videos on youtube about the same amount of time, went to Buddy's (kb5elv) instruction sheet and inserted the instructions over and over, reset and tried again and again to get this thing to access my repeater W2ABC 147.270, + 600 mhz offset (to 147.870), and the tone at 141.3, and it WILL NOT access the repeater.
I have an ICOM 90t and used it right next to this new "feng" and the ICOM goes right in. The FENG doesn't even acknowlege the receipt of the ICOM that is transmitting within 12 inches of it.
I talk to my guys on the ICOM and told them of the situation and they said "try it again" and....nothing. The ICOM doesn't register through the repeater to the "FENG".
Using the "FENG" in simplex I can talk and receive quite well; but accessing my repeater....NADA.
I have to be leaving something out or the instructions aren't complete and more informative.
Anybody out there know something I'm doing wrong or not adding or taking away from the operation of this radio or MAYBE this radio is "FENGED UP!"

Don't use the radios 12 inches apart.

Program 147.270 along with all necessary codes then save to an open memory spot. Immediately enter 147.870 and go back into menu and save again in same memory. Should say transmitting frequently when saving the second frequency.

Then test with radios farther apart. Does simplex work? Failing that, test with a speaker mic. I got a UV-5R with bad solder joint on the PTT button. Needs a speaker mic until my new button shows up from China.

lets program this repeater to memory.
check channel mode to see what channels are availible. If there are some preprogrammed freqs, do an "all" reset of the radio via menu 40 to clean everything out.

Set the radio in frequency mode.
make sure you are in the right band IE vhf and not UHF.
Also make sure you are on A on the display and not b.
turn off your dual stand by and set your primary transmit band to 0 so it doesn't lock to A or B. see the menu and menu function list in the eyes free document on which menus to set for stand by and primary transmit.
Also set the radio to wide, and 5KHZ step via the menus.
Now, do the following in exactly this order:
go to menu 13 and select your t ctcss tone of 141.3. press menu to confirm and press exit.
now, key in, via the keypad, 147270.
press menu, 2 7 and menu and select a channel. Press menu to confirm when you have selected the channel number you want. It will say receive frequency stored or something very similar.
press exit to return to the frequency mode.
Now, press the star/scan/reverse key, the one to the right of the #3 key, and key in 147870 via the keypad. Press menu, 2 7, select the same channel number you did for the receive frequency, and press menu to confirm. It will say transmit memory stored. Press exit to go back into frequency mode.
Now, press the button to take you to channel mode and confirm that you have programmed 147270 into a channel memory location.
When you key up it should show 147.870 while you are transmitting.
it's very important that you turn off dual stand by, and set the radio to A before programming anything.
I purposely ignored the shift and offset menus because it's more steps than is required to program a frequency pair into memory.
it doesn't matter what shift or offset direction you have preset in the menus, because you are manually programming your receive and transmit frequencys.
Another note, set your tx power to high or low via menu 2 before programming a memory channel. it will default to high. You can always toggle your tx power while on a memory channel by pressing the pound key to the right of the 9 key.

hope this helps a little.
if the radio works on simplex, it'll work on a repeater obviously.

oh, another note, set menus 35, 36 and 37 to 0 or off because they will cut off curtesy tones and short repeater tails if you leave them in their default on state.

He did say he couldn't hear the repeater tail on the baofeng even when he could hear it on the ICT90a, so there is no desensing going on at that point.

Hi Colin:

Did all that and still nothing.
Everything not associated with repeater operation is off.
  On high power simplex I can talk to my group
using the FENG, within a radius of about 6-10 miles with no problem.
Simplex between my Icom and the Feng works well from one floor of my house to another.
(I exagerated the distance between the radios, just to make a point.)
And yes, if this thing works simplex it most certainly should work repeaters.
 When I come into the city and try using this W2ABC repeater, which by the way, is
connected through the "Mouse Network" of Disney and TV & Radio WABC in New York, Florida
and California, with the FENG, not one connection to nowhere.
Then I turn on the Icom, key up, and TA DA, there you go!
Both the Icom and the Feng show about 4.5W output power on my spectrum analyzer after
calculating and converting the db's, and the 60 db of attenuation installed on the input,
so I know the thing is getting out.
Does the xmit and rcv tone menus have to be filled with the same freq of 141.3 or only the
xmit or only the rcv?

oh, another note, set menus 35, 36 and 37 to 0 or off because they will cut off curtesy
tones and short repeater tails if you leave them in their default on state.

He did say he couldn't hear the repeater tail on the baofeng even when he could hear it on
the ICT90a, so there is no desensing going on at that point.

Don't use the radios 12 inches apart.
Program 147.270 along with all necessary codes then save to an open memory spot.
Immediately enter 147.870 and go back into menu and save again in same memory. Should say
transmitting frequently when saving the second frequency.

Then test with radios farther apart. Does simplex work? Failing that, test with a speaker mic. I got a UV-5R with bad solder joint on the PTT button. Needs a speaker mic until my new button shows up from China.

Hi Colin:

Did all that and still nothing.
Everything not associated with repeater operation is off.
   On high power simplex I can talk to my group
using the FENG, within a radius of about 6-10 miles with no problem.
Simplex between my Icom and the Feng works well from one floor of my house to another.
(I exagerated the distance between the radios, just to make a point.)
And yes, if this thing works simplex it most certainly should work repeaters.
  When I come into the city and try using this W2ABC repeater, which by the way, is connected through the "Mouse Network" of Disney and TV & Radio WABC in New York, Florida and California, with the FENG, not one connection to nowhere.
Then I turn on the Icom, key up, and TA DA, there you go!
Both the Icom and the Feng show about 4.5W output power on my spectrum analyzer after calculating and converting the db's, and the 60 db of attenuation installed on the input, so I know the thing is getting out.
Does the xmit and rcv tone menus have to be filled with the same freq of 141.3 or only the xmit or only the rcv?

lets program this repeater to memory.
check channel mode to see what channels are availible. If there are some preprogrammed freqs, do an "all" reset of the radio via menu 40 to clean everything out.

Set the radio in frequency mode.
make sure you are in the right band IE vhf and not UHF.
Also make sure you are on A on the display and not b.
turn off your dual stand by and set your primary transmit band to 0 so it doesn't lock to A or B. see the menu and menu function list in the eyes free document on which menus to set for stand by and primary transmit.
Also set the radio to wide, and 5KHZ step via the menus.
Now, do the following in exactly this order:
go to menu 13 and select your t ctcss tone of 141.3. press menu to confirm and press exit.
now, key in, via the keypad, 147270.
press menu, 2 7 and menu and select a channel. Press menu to confirm when you have selected the channel number you want. It will say receive frequency stored or something very similar.
press exit to return to the frequency mode.
Now, press the star/scan/reverse key, the one to the right of the #3 key, and key in 147870 via the keypad. Press menu, 2 7, select the same channel number you did for the receive frequency, and press menu to confirm. It will say transmit memory stored. Press exit to go back into frequency mode.
Now, press the button to take you to channel mode and confirm that you have programmed 147270 into a channel memory location.
When you key up it should show 147.870 while you are transmitting.
it's very important that you turn off dual stand by, and set the radio to A before programming anything.
I purposely ignored the shift and offset menus because it's more steps than is required to program a frequency pair into memory.
it doesn't matter what shift or offset direction you have preset in the menus, because you are manually programming your receive and transmit

frequencys.
Another note, set your tx power to high or low via menu 2 before programming
a memory channel. it will default to high. You can always toggle your tx
power while on a memory channel by pressing the pound key to the right of
the 9 key.

hope this helps a little.
if the radio works on simplex, it'll work on a repeater obviously.

for most ham repeaters, yes, the tx and rx tones have to be the same if you want to use RX tone. You can use different rx and tx tones on this radio if you wish though...dependant upon the repeater of course.

Other wise, just leave that menu, that is, menu 11 set to off before programming the repeater into memory.
I typically don't use rx tones for this very reason, but try setting your rx tone to 141.3 or to off if it isn't there already and reprogramming.
Don't forget, you have to delete the memory channel before reprogramming into the same memory location.
it's very strange that you aren't even hearing the repeater.
have you been programming the rx tone to 141.3 all along? if so, perhaps the machine you are trying to hear isn't actually transmitting a tone?
try turning the rx tone off and reprogramming to see if you can hear it.
also make sure both dcs menus, that is 10 and 12 are set to off.
check busy channel lock out too. make sure that didn't get turned on by accident.
Like I said, a full "all" reset will set all this stuff back to default.
We know your radio is functioning normally because you can tx and rx fine on simplex. It sounds as if there might be something fishy with the tones when you try to program a repeater.
this might be elementary, but you must press the menu to confirm your settings, then press exit. Pressing exit immediately after selecting the tone in menu 13 will leave it set on whatever it was on before.
have you tried programming via software?
and if so, do you get the same results?

yep, definitely sounds like a ctcss tone issue...or, you are simply unable to get into the repeater with the UV5R and current UV5R antenna...
is that the only repeater you've tried?
are there other repeaters close by that you can try programming to see if they work on the uv5R?
maybe that 141.3 tone is a bug in the radio.
Can others confirm or deny this?

Yeah I know... its strange I can't hear the repeater acknowlege the Feng like I can with the Icom.
    No, I haven't tried programming with software 'cause I don't have the patch cord for doing that yet. AND, where can I get functioning software?
I've tried downloading the software from various sites but for some reason I haven't gotten software that is "activatable"; they all say run, run, unzip, etc., and when I go to the file it's supposedly put in, it's not there!

I don't know, but since I got this Feng I can't find things in the places I know they are supposed to be; like my wife.....and I found her leaving on a cruise with her girlfriends to Canada the same day this radio came into my posession! L.O.L. !! !

thanks for listening and trying to help

I only have one radio. How do I export the file. I have all the channels entered into the Chirp software and hate to lose them.

File -> Export to create a .csv file you can import into other radios.
File -> Save to create a UV-5R specific .img file that includes all of your settings as well as the programmed channels.

This sounds like a CTCSS/DCS issue. When tuned to the repeater channel and in receive mode, there should not be a 'CT' or 'DCS' indication to the left of the frequency/channel display. After you press the PTT button, you should see 'CT' and not 'DCS' to the left of the frequency/channel display. If these two things are not correct, then this is your problem. If they are correct then it is possible that the correct tone was not entered. It is also possible that you accidentally turned on Menu 23 (busy channel lockout). To 'fix' any of these issues requires that the channel be deleted and reprogrammed.

So switch to frequency mode
Delete the channel with Menu 28
Enter the RX frequency (147270)
Make sure Menu 10, 11, and 12 are set to OFF (0)
Make sure Menu 13 is set to 141.3Hz (1413)
Make sure Menu 23 is set to OFF (0)
Store these settings into the desired channel with Menu 27
Enter the TX frequency (147870)
Store this into the same channel with Menu 27

Now switch to channel mode and select the channel that you just programmed. The 147.270 RX frequency should be displayed. To the left of the frequency/channel display there should not be a 'CT' or 'DCS' indication. Now tap the */SCAN key. An 'R' should appear in the top status line of the display and the 147.870 TX frequency should be displayed. To the left of the frequency/channel display there should be a 'CT' indicated. While in this 'reverse' mode, have someone take the ICOM tuned to the repeater into another room. You should be able to talk HT to HT. If this works, tap the */SCAN key to exit reverse mode and talk on the repeater. You should be good to go.

Good luck and 73,
Jim KC9HI

i may be missing the point, but if you are talking about copying memory channel data from one radio to radio of another make, this is what i do:
CHIRP can open two files(data sets) simultaneously, like tabs on a browser.
its not difficult to copy / paste channel data from one data set to another; and multiple channel data can be selected at the same time using the Shift key.
hope this helps someone!

With CHIRP you have to read from the radio first to get a 'template' for it and then do your editing to that template.

If you entered you channel data before reading from the UV-5R, you have a generic template that probably won't upload to any HT.

To keep from losing what you have already programmed, you should to a File|Export and export what you have to a .csv file. Then you can read from the radio to get a UV-5R template. Then do a File|Import to add what you have already done to the UV-5R template.

Another method would be to read from the UV-5R after loading and displaying your original CHIRP data. The template from the UV-5R will be in a second tab. You should be able to cut and paste between tabs.

Good luck and 73,
Jim KC9HI

I've different brands of HT too and here is how I transfer the frequency list from one HT to the other.

Step:
1: Connect your Wouxon to Chirp and select "download from radio" to create a image file, next export to CSV file.

2. Connect your Baofeng to Chirp and select "download from radio" to create a image file.

3. Open the CSV file created from Wouxon, and select "upload to radio".
(This step will transfer your Wouxon frequency list to Baofeng)

Hope this helps.

Mike,

When I Googled W2ABC I noted that it was a D-Start repeater. Don't know much about D-Star. Is it possible that settings are different in order to be able to access in Analog mode? JL

Other repeaters to try:145.290- 94.8 K2HR Manhattan New York OPEN
145.570s 192.8 WR2MSN Manhattan New York
147.000- 136.5 WB2ZSE Manhattan New York OPEN
147.150+ 136.5 N2JDW Manhattan New York OPEN
147.195+ 136.5 W2ML Manhattan New York OPEN
147.240+ 94.8 K2NYR Manhattan New York
147.270+ 141.3 W2ABC Manhattan New York OPEN
147.360+ 107.2 WA2ZLB Manhattan, Rockefeller Center New York OPEN

.

Subject: Re: [baofeng_uv5r] brand new UV5R

Hi Colin:

Did all that and still nothing.
Everything not associated with repeater operation is off.
   On high power simplex I can talk to my groupusing the FENG, within a radius of about 6-10 miles with no problem.
Simplex between my Icom and the Feng works well from one floor of my house to another. (I exagerated the distance between the radios, just to make a point.)
And yes, if this thing works simplex it most certainly should work repeaters.
  When I come into the city and try using this W2ABC repeater, which by the way, is connected through the "Mouse Network" of Disney and TV & Radio WABC in New York, Florida and California, with the FENG, not one connection to nowhere.
Then I turn on the Icom, key up, and TA DA, there you go!
Both the Icom and the Feng show about 4.5W output power on my spectrum analyzer after calculating and converting the db's, and the 60 db of attenuation installed on the input, so I know the thing is getting out.
Does the xmit and rcv tone menus have to be filled with the same freq of 141.3 or only the xmit or only the rcv?

TNX, Mike, W2WDE

From: toledohamradio
Topic: 7128 Message: 7147

Two suggestions: I would leave the RX PL tone OFF, so it's open to everything, and would program only the transmit PL tone.

If you have a decent RS scanner with "CT" or PL, use the 'tune' function and set it to your transmit frequency and scan 'CT', and when you key-up it should show you your PL tone if it's a close enough match.
You could also use your scanner with a decent antenna and check a friend's rig on the repeater input to see what his PL is.

Good luck; 73, John

Estou aqui no Brazil, Amigo.

Tem outra também :

Estes chineses mais parecem portugueses ! ! ! ! !

Porque ?

Resposta : Porque só quando a portadora vai embora é que se acende o display dos Baofengs . . . . . .

Onde já se viu isso ?

Repetindo: só depois que a portadora vai embora (estando eles no modo SCAN), é que o display se acende.

Desta forma, como vamos saber em que frequencia o HT parou e encontrou uma portadora ?

Vocês estão me entendendo ?

Deveria ser exatamente ao contrário, ou seja:

O display deveria se acender, logo que encontrasse uma portadora.

Mas não.

Acontece exatamente o contrário : o display só se acende, só se liga, quando a portadora vai embora . . . . . .

Será que alguém não poderia transmitir este verdadeiro e terrível ERRO DE PROJETO para os chineses ?

Assim eles poderiam providenciar a correção deste erro.

Obrigado.

Um abraço à todos os amigos do grupo.

From: Jim
Topic: 7148 Message: 7150

The A/B key toggles between the A (upper) frequency/channel/name display and the B (lower) frequency/channel/name display.

The 'arrow' (or triangle) is positioned to the left of the currently selected display. Transmitting is always done on the selected display.

A flashing 'arrow' indicates a display is receiving a signal.

If Menu 7/TDR (dual watch) is ON and Menu 34/TDR-AB (dual watch priority) is set to OFF, the 'arrow' will switch to the display with activity and begin to flash. The display that was switched from will have a solid 'triangle' to indicate that the switch was made. The display with the most recent activity will remain selected.

Note: Using the [UP]/[DN] keys do not change the active display. It changes the selected channel of the currently selected display. When dual watch is active, this action could stop activity on the current display which would then allow activity on the opposite display which could trigger a switch to the other display.

If Menu 7/TDR (dual watch) is ON and Menu 34/TDR-AB (dual watch priority) is set to A, the selected display is forced back to the A display when activity on the B display ends. This effectively disables the A/B key.

If Menu 7/TDR (dual watch) is ON and Menu 34/TDR-AB (dual watch priority) is set to B, the selected display is forced back to the B display when activity on the A display ends. This effectively disables the A/B key.

I home that helps.

73,
Jim KC9HI

You can't do it manually. You must use a PC and programming software (either Baofeng or CHIRP) to add the channel names.

7160. RE: [Wouxun_KG-UVD1] Re: Moved on to Baofeng-UV5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-31 23:56:49 UTC
From: J.Gordon Beattie, Jr., W2TTT
Topic: 7160 Message: 7160

Jon et al,

OK, I have both the Wouxun and the Baofeng UV-5R and like them both differently.

The Wouxun is actually two radios.the 144/440 and 144/222.they work just fine

Sturdy - drops and survives

Well made - solid finish to the build of the radio

Audio loud and great into the speaker

Average HT audio over the air

No 2.5 kHz channels

Had to use special software to "open" transmit for other services

Wouxun software is better

The Baofeng UV-5R.I have four of them

Cheap - $50 delivered vs. $100+

Compact package

Baofeng software is awful, but Chirp helps a lot!

Factory opened to full range

2.5 kHz channels

Average HT audio into the speaker

Sounds great over the air

Had an issue with the external connector not shorting when the programming cable or headset or speaker/microphone were withdrawn causing no audio to come out. Ended up having to use the radio with a headset or speaker/microphone. The factory will replace the radio when I send the body back to them.

The belt clip screws did not reach on one radio and in another they did not hold the clip onto the radio. Crazy Glue solved that.

So given all this would I buy either one again?

YES!

1. I would consider buying the "6" model Wouxun if I needed the 2.5 kHz on a robust package. Otherwise, the 1,2, or 3 models are fine for most Amateur use.
2. I would buy the Baofeng UV-5R again. I will probably do so because they are cheap, functional and effective.

Bottom line: For everyday use, I would use these as the UV-5R, based on cost and functionality. At its price, I can carry two as either a backup or to give out to someone else, if needed.

Thanks & 73,

Gordon Beattie, W2TTT

Subject: [Wouxun_KG-UVD1] Re: Moved on to Baofeng-UV5R

Good Morning Deepak,

You have me curious what you folks use the Baofeng or Wouxun for in your area? I was given the Baofeng UV-3 Mk II for my birthday several months ago, just in time for a canoe race a bunch of local hams help on communications. For one set of races, a series of sprints, it was great as it was light and worked well to have simplex radio contact for the short distance of a half a mile or less. Also works nice into the local repeater 4 miles away.

Several of my friends have the Wouxun. While it does have some nice features my Baofeng is easier to program. I found the Chirp software, a free download really nice to work with on programming frequencies. If someone has used in on the Wouxun, please tell us your thoughts. Chirp will work on many radios. The website is:
http://chirp.danplanet.com/projects/chirp/wiki/Home

BTW I have a son that spent some time in India working with some of your computer programmers.

Download & install the latest nightly builds of chirp, and you wont have
to hack on the DAT files.

7162. BaoFeng UV-5r microphone/earphone jack quality issue

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-01 02:21:10 UTC
From: fdcampbell1
Topic: 7162 Message: 7162

I purchased qty. 30 BaoFeng UV-5r's from "Fujian Nan'an Baofeng Electronics Co., Ltd", China. These radios were slated for a local amateur radio emergency response group.

All units operated out of the box.

But, when either a factory supplied programming cable or the included external microphone/earphone was first used, a number of the radios did not return to proper operation upon removal of the cable.
Specifically, the internal microphone and speaker did not return to operation when the cable(s) are removed.

There is apparently a problem with the construction (or quality) of these two jacks.

Communication with Fujian Nan'an Baofeng Electronics Co. regarding this problem resulted in an email with a proposed modification to the pc board to alleviate the problem (clearly they had encountered the problem previously).

The "fix" is not satisfactory. It leaves the internal microphone continuously connected, compromising the usage of the external microphone. It also compromises the use of this radio for APRS and packet.

I am currently trying to get the defective radios replaced but the distributor is going sideways, trying to avoid having to honor the warrantee.

I am sending this to the Yahoo Group as an advisory regarding a) the quality issue and b) warrantee replacement difficulties in dealing with this China based distributor.

If anyone would like a copy of the "modification memo", complete with pictures of the proposed modification, I will be glad to forward a copy. Send a note to fdcampbell1@....

Having a ball with my new UV-5R from Amazon and the programming cable worked with CHIRP the first time

BFB251

1203211 V5

I do have a question concerning the display information.

In the VFO mode just the + or the – is displayed depending on which was selected in the menu for shift.

In memory mode both the + and – are displayed for repeater shift. Is this correct…

thanks

Others with that problem have solved it by inserting and removing
the plug a number of times.

7170. Mine came today! Woohoo. 3600mah battery clasp fix

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-01 06:02:18 UTC
From: Tom Owen
Topic: 7170 Message: 7170

I subscribed to the group when I first ordered the radio on the 18th and it finally arrived, neatly wrapped like a Christmas package. Maybe that analogy work because I felt like a kid at Christmas.

Anyway, I ordered the 5R with the 3600 Mah battery. My battery *did not* secure in the clasp as others have experienced.

The problem was not the battery case, that fits well. The problem is a small lip on the latch on the battery. There are corresponding clasps: 1 molded to the battery that mates with the release button on the radio. I took a small flat bladed screwdriver and gently "de-burred" the leading edge of the hook in the battery side. Took a few passes but after not a lot of effort, Snap! Locked into place. A solid connection every time.

Anxious to fire up the pc and try to begin programming the radio. (I'm leaning towards Chirp because the repeater offset vs. programming tx and rx separately. - existing data notwithstanding, input welcome.

Looking forward to participating now as a user vs stalker ;-)

This problem and has been reported fairly regular for as long a I have been monitoring the group. Some have restored use by repeated plugging and unplugging the programming cable or speaker mic cable. Some have included canned compressed air to the procedure thinking debris might be keeping the internal contacts from closing properly. I believe I remember one member claimed to have replaced the jacks but a source for the replacements was not discussed. Some were happy to just continue using an external speaker mic and others have been successful at getting the transceiver unit replaced by their dealer. Hopefully you will be successful in getting your issue resolved.

Welcome to the group. We are glad you are 'having a ball'.

What you are experiencing is normal operation. Here's why...

When in VFO/frequency mode the UV-5R uses menu 25 with menu 26 to determine the TX frequency from the RX frequency. So in this mode the firmware just echos the setting of menu 25 ({blank}, + or -) to the top status area of the display.

When in MR/channel mode the UV-5R has no concept of 'shift direction' or 'offset' from the RX frequency. Each channel is stored with the RX frequency and TX frequency. So in this mode the firmware just displays if the RX and TX frequencies are the same ({blank}) or not the same (+-) to the top status area for the display.

Note: With CHIRP the Duplex (shift direction) and Offset are used in the spreadsheet view to define a channel. Since the UV-5R doesn't understand what shift direction and offset are in channel mode, CHIRP does the math in the background and sends the calculated TX frequency to the UV-5R.

Unless the question referred to having a "private" channel for just the 2 of you. The answer to that would be no. You can create through settings a frequency where your wife can only hear you and you can only hear your wife, but others will be able to hear you both.

Without encryption there is no privacy in radio communications. Even then the pseudo-random generator sequence can be hacked, but thats another story for another forum.

I didn't help at all did I?

Andy

You would probably be better served by a FRS Handy Talkie radio from Radio Shack or Walmart. The UV-5R is really better suited to Amateur or Commercial radio users with some radio experience and knowledge of legal frequencies and uses.

for the last line (120724A / 281) you can also add that the volume bug is fixed too - it goes all the way down.

7186. How common is this problem with the UV-5R?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: Don
Topic: 7186 Message: 7186

After reading about this problem (quoted below), I am nervous about using the programming cable with the UV-5R (not yet in my possession).
How common is the problem? should I be paranoid about it or not?

Quoted text follows...

I purchased qty. 30 BaoFeng UV-5r's from "Fujian Nan'an Baofeng Electronics Co., Ltd", China. These radios were slated for a local amateur radio emergency response group.

All units operated out of the box.

But, when either a factory supplied programming cable or the included external microphone/earphone was first used, a number of the radios did not return to proper operation upon removal of the cable.
Specifically, the internal microphone and speaker did not return to operation when the cable(s) are removed.

There is apparently a problem with the construction (or quality) of these two jacks.

Communication with Fujian Nan'an Baofeng Electronics Co. regarding this problem resulted in an email with a proposed modification to the pc board to alleviate the problem (clearly they had encountered the problem previously).

The "fix" is not satisfactory. It leaves the internal microphone continuously connected, compromising the usage of the external microphone. It also compromises the use of this radio for APRS and packet.

I am currently trying to get the defective radios replaced but the distributor is going sideways, trying to avoid having to honor the warrantee.

I am sending this to the Yahoo Group as an advisory regarding a) the quality issue and b) warrantee replacement difficulties in dealing with this China based distributor.

If anyone would like a copy of the "modification memo", complete with pictures of the proposed modification, I will be glad to forward a copy. Send a note to fdcampbell1@....

And don't believe the 27 mile range. No matter what, you'll only
average about 2 miles on UHF no matter what they claim. The $10
units work as well as the $100 units. Fixed antenna and low power.

Don,
Just to be clear, this is not a programming cable issue. It could happen with a speaker mic or anything else that would plug into the speaker/mic port.

There is no way to know for sure but I'd say based on hearing a complaint maybe 1 or 2 times a month and the >2600 group members, the odds of having the problem is small. Small enough to be ignored. No.

More than one group member has been successful at restoring functionality by using some combination of plug-unplug sequence, compressed air and/or contact cleaner. Others have returned them for replacements.

If you know exactly what you want your channel setup to be, and it will remain fairly static, then you most certainly can enter it via the keypad and be done with it.

In my situation, I am constantly 'blowing away' my channels to try out different situations. This way I can figure out exactly how something works in order to more clearly explain an answer to someone's question. After I'm done, I pop in my programming cable and restore my channel setup. There are times I might plug my cable in 20 or more times in a day. I never worry about it.

And another note for those who don't read small print.. most of the 22 channel bubble packs have both FRS ans GMRS.. GMRS does require a licence as well. Currently $85.00 if I am not mistaken rendering most of the 22 channels non usable with out a licence. And due to possible power setting making some of the FRS channels fall into the need a licence area. Make sure you get what you want the first time. One last note a GMRS licence is good for the holder and immediate family and doesn't require a test as it is fee based.

7190. TYT TH-UVF9 battery fits UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: tore_bjornsen
Topic: 7190 Message: 7190

Hi!

Just wanted to let you know that the battery for the TYT radio TH-UVF9 fits the UV-5R. The interesting thing is that this battery charges with a plug directly into the battery, and that the TYT radio comes with both a mains charger and a car charger as standard. The UV-5R battery also fits the TYT radio..

Btw. This radio is also easier to program manually, and has 2 sets of 128 channel memory. It mises the led light though.

Anyway, if you need a car rechargeable UV-5R, try to get a battery and car charger for this TYT radio.

I have uploaded some pictures in the files area, in the folder TYT - Baofeng. You can see the TYT battery vs Baofeng battery.

73 - LA4UPA

Tore

7191. Neat little radio but...

I ordered one of these little babies from a chinese company on a whim basically, before knowing that much about it - only saw a review or two before placing an order... I'm impulsive that way ...

While waiting for it to arrive I started checking around a bit more and it got to the point I didn't want to wait anymore so I ordered another one from a european company too (as I am european).
I mainly bought it to use as an emergency radio in my boat so I figured I could use the other unit in my house when I'm out at sea...

So - playing around with the one I got so far I must say it's one of the best invested $50 ever, it's got a ton of stuff - however what I AM missing is this:

1) Start and stop freq. scan ranges.

2) Adjustable scanning speed.

3) Signal strength meter, at least mine is always showing full or no bars.

4) Too sensitive PTT button.
At least my PTT button is extremly sensitive and I keep pushing it by mistake, a short TX-delay would solve that, or stiffer pushbutton, or even simpler - the keypad lock could also lock the PTT button.

5) I love a good old fashion ON/OFF/volume control turn knob, though a bit more friction to it wouldn't hurt - so you don't turn it up/down by accident.

6) A couple more (separated) memorybanks (surely just 128 channels is a bit on the low side these days, hey - there's even room for lots of voice sampling you know).

It would be a truly awesome little radio if these matters could be addressed, but hey - I guess you can't expect too much for $50 :)

You guys don't happen to know if there's a custom firmware project out there?
It would be so cool to be able to request features one could think of.

Just my $0.05 :D

Well, just received my UV-5R. Still trying to find my way around. If not for this group and the Miklor site, I would be totally lost. Keypad programming is not very intuitive and the menu labels are all cryptic. I had to refer to the description on the Miklor website for almost all of the label meanings. I decided to take the risk and plug in the programming cable. I am happy to report that the cable worked just fine, I was able to download data from and upload data to the radio without any problems. Also, on removing the cable, I have not noticed any untoward effects like the internal speaker being muted. I have not tried the PTT button yet because I don't have my ham license just yet (will be getting it in a few weeks).

You are stuck with most of the warts (features). Try an O ring under the volume knob to add some friction- it works great on some radios.

Greg,

Frequency mode scanning range setting is sort of doable. Get yourself a programming cable and CHIRP and/or the Baofeng VIP software.

With CHIRP go to the Settings|Other Settings tab and adjust the VHF and/or UHF upper and lower limits and then upload the changes to the UV-5R. Say you set the VHF lower and upper limit to 154 and 155 respectively, VHF frequency mode scanning will begin a 154.000 and end at 155.999.

With the Baofeng VIP software you would make a similar settings on the Other page and then upload to the UV-5R.

Just be aware that your ability to program from the keypad will be limited the same range. Existing channels outside that range will be unaffected.

And lastly there is no custom firmware project because the firmware is not upgradable.

It's normal. I don't know why but I saved mine off to a file. I think someone uploaded the same thing to the group so I'm not the only one. LOL

If you don't have a programming cable, the quickest way to delete them all is to do a Menu 40 (RESET) ALL. But even that leaves channel 0 programmed with something.

Well at this point I still don't have a brand name to compare it too. However I would like to say it seems as though this is the little radio that could. The more I learn about its capabilities the more satisfied I am with my purchase. I bought the little yellow 5r and love love love it. I have ordered a new Diamond antenna for it am eagerly awaiting its arrival. I also ordered a new 3600 battery for it. I got the cable with mine so today I ordered a new 5r for my wife with the extra battery and antenna in a package deal. I am getting an adapter with about a 6 in lead on it so I can hook it to a mobile antenna in the car too.. I truly think until I can afford the "dream HF rig" I have found my daily little UHF VHF work horse. Thank you all for the time put into this group that made the initial understanding happen. I preach this group every chance I get. Funny among old timers who have all the Brand name radios and the newbies getting these, this is quickly becoming a Brand name radio. The one no one can pronounce. Have you noticed the new HT from Yaesu resembles the Baofeng? or is it just me?

I tried downloading the software and I guess it didn't unzip correctly or something. Could someone please send me a link and step by step instructions on how to work this software? I'm super new to amateur radio and I'm not a techie at all. Also, what's this CHIRP software? My goal here isn't to learn to be a major tech head. I do, however, want to be able to build my own antenna and, possibly, my own transceiver. I just want to talk to folks in Alaska and remote parts of Canada. But, I've got a long road ahead of me if I can't even load some software right.

Subject: [baofeng_uv5r] Re: Display +-

Welcome to the group. We are glad you are 'having a ball'.

What you are experiencing is normal operation. Here's why...

When in VFO/frequency mode the UV-5R uses menu 25 with menu 26 to determine the TX frequency from the RX frequency. So in this mode the firmware just echos the setting of menu 25 ({blank}, + or -) to the top status area of the display.

When in MR/channel mode the UV-5R has no concept of 'shift direction' or 'offset' from the RX frequency. Each channel is stored with the RX frequency and TX frequency. So in this mode the firmware just displays if the RX and TX frequencies are the same ({blank}) or not the same (+-) to the top status area for the display.

Note: With CHIRP the Duplex (shift direction) and Offset are used in the spreadsheet view to define a channel. Since the UV-5R doesn't understand what shift direction and offset are in channel mode, CHIRP does the math in the background and sends the calculated TX frequency to the UV-5R.

Don,

These channels are the residue of the testing that the radio went through before shipping. I would be more concerned if there were not any channels in memory.

Subject: [baofeng_uv5r] Pre-programmed memory channels?

Just received my UV-5R and noticed that it already had several (I think about 21) channels pre-programmed. Is this normal for a factory-fresh radio? I hope the seller did not send me a used unit!

thought they were chinese cb channels or something....lol
it's amazing how many people scratch their heads at this one...is there nothing in the manual that says your radio may come preprogrammed with some frequencies?
I know, I know, the manual is less than desirable on pretty much any information lol.

Siloam Springs, AR, 146.67,-,KC5YZI,110.9
146.67 Your Rx frequency
- Direction of Offset
110.9 Tone required to access repeater
For VHF, Offset is normally 0.6 and UHF 5.0
Hope that helps.

In CHIRP set it up a channel like this...

Frequency = 146.670000
Name = KC5YZI (or 7-characters of your choice)
Tone Mode = Tone
Tone = 110.9
ToneSQ = default is fine - not used
DTCS Code = default is fine - not used
DTCS Pol = default is fine - not used
Cross Mode = default is fine - not used
Duplex = off (inhibits transmit - set to '-' once you get your license)
Offset = 0.600000
Mode = FM
Power = Low (don't use High unless necessary - won't matter until you get your license)
Skip = {blank} (set to 'S' if you want channel skipped while scanning)

Upload to UV-5R

Welcome to the group. Good luck with your license. Have fun with your UV-5R

Wow Jarod:

Let's digress back to your original post. You mention wanting to become a "Tech Head". Good. Now lets talk antenna's. DIY antenna's is a blast and there are many types and specific uses for each antenna. There are lots of resources. If you can find a local ham with an analyzer it would be great. There are lots of details with antenna's and you want to get these details right. Six months from now it will be old hat. Respond to me directly and I will dig some up. I am always happy to help. I have a teaching background and am a bit heavy on the "Geek" side.

Do you have a local club to attend? I am sure somone in the group is clsoe enough to your area to guide you. Don't worry about asking lots of questions, we are here to help. There are lots of questions to be asked. The hobby can be a bit intimidating at first. It sounds like you want to learn, you will do just fine.

Some of us have been at this for decades. It is second nature. We have to stop every now and then and look back at the struggles and fog we were in when we started.

And yes, it helps to be more specific with the questions, you will get the hang of it.

Andy

Jared, you NEED a copy of FM101x by AC6V. This will tell you the nuts and bolts of how to actually operate and a bit about how repeaters work. It is not very useful for studying for the test, but it is VERY useful for understanding what is actually going on. If you can't find a copy anywhere else I can sell you one for a check for $15 plus $4 packing and postage. But I am really not set up to mail them, so better to find another source. If you have an HRO nearby, they may carry it.

If it's from Sinotel UK they come with "all the UK 2m & 70cm repeater frequencies & offsets pre-programmed into the memory along with the eight European PMR 446 frequencies".

In this CHIRP program, what exactly sets my negative or positive offset? I see the setting for "offset", but I don't see where I have a choice of negative or positive. I'm afraid to just go in there and get all crazy typing stuff in, because I don't want to screw up my radio. I also need to look in my books and find out what frequencies are UHF and VHF.

Put a + or - in the Duplex column. VHF is 100s and UHF 400s in round numbers.

Under the Radio menu, I have checked "Automatic Repeater Offset". It will automatically program 0.600 mhz in the Offset column (for 2m, or 5.0 mhz for 70 cm) and the conventional + or - in the Duplex column.

In the Duplex column click the cell and chose from the drop-down list (None) for Simplex, that is, transmit and receive are the same frequency as in Frequency column.

Chose "off" for receive only, disabling transmit. I have done this on the NOAA weather channel and some marine channels I monitor.

+ and - will be automatically selected, but there are repeaters with odd offsets and shifts, so you may override those selections.

73,

Hello people,

recently bought a UV5R, thought at the price i may get some use out of it, I love this radio already talk about features. software was no problem, interface works first go very impressed, then i found this resource, great group! keep up the good work, should be able to throw in my two bobs worth from time to time

Cheers

So I can't find anyone to "Elmer" me. Thanks for everything.
> Jared

Jared, you are in Arkansas. I'm in southern Louisiana. I'm sure you should be able to find an "Elmer" there, but I'd be more than happy to help meanwhile. Meanwhile study this:

http://www.hamuniverse.com/repeater.html

http://www.repeater-builder.com/rbtip/repeater101.html

At home I have a Repeater Directory, so I can look up nearby repeaters and help you program them. Here in my area I note there are repeaters listed that are not really on the air. You need to find out locally if that is permanent, if you are using a wrong frequency, a wrong tone, etc. Best way is to look up your local repeater's owner (it's in the directory, will have the owner's call sign), then locate him by looking up his call sign at QRZ.com, find his name and email. Or look him up in the phone book. He will likely be able to give you a list of repeaters in your area, which ones are good, which ones inactive, which ones often used, etc. You can find repeater info online, too.

http://k5ehx.net/repeaters/qrepeater.php

http://www.levinecentral.com/repeaters/google_mapping_distance.php

http://www.repeaterbook.com/

http://www.usrepeaters.com/

http://www.artscipub.com/repeaters/states/arkansas.asp

http://rptr.amateur-radio.net/arn/rptr/index.html

So you are studying for the test? I'm a W5YI CVE... that's a Contact Volunteer Examiner, and that means I'm the guy that gives tests locally. Before you begin to think I'm some sort of great ham guru, I've only been a ham a little over 3 years. I'm not so far from being right where you are that I've forgotten how confusing all this can be.

Would you mind if I send you, by email, a suggested and successful course of study for the exam? I'll copy/paste below. Also, I want to suggest that you study for the General at the same time. No, I'm not yankin' your chain. If you can pass the Tech, you can pass the General, too. It really isn't much harder. At least look over the material.

If you pass the Tech, you should be given the opportunity to take the General at no extra cost.

73,
Paul - AE5JU

This is the copy/paste... DO THIS!!!

Go to this site:

http://www.w5ddl.org/

And on the left side you will see links to Classroom Presentations (in PowerPoint) for Tech and General, as well as links to practice exams for Tech, General, and Extra class. If you don't have PowerPoint, there is a link for a free PowerPoint Viewer.

In each of those two links you will find both the separate chapters, as well as a zip file containing all of the chapters.

Here is another site with classes:

http://www.rarchams.org/class/technician/chartsppt09/index.htm

There are also courses of study that may be subscribed to at:

http://www.hamtestonline.com

(NOTE- When you print out these guides, yes, print them... take a Magic Marker and black out all the wrong answers. This way you study only the correct answers and everything else looks unfamiliar. Seriously, print, black out, study. Just take my word for it and do it.)

Study Guides - right click on these links and Save As:

Tech:

http://www.ncvec.org/page.php?id=349 2010 Tech Test Pool

http://www.kb6nu.com/wp-content/uploads/2010/06/2010_Tech_Study_Guide.pdf

General:

http://www.ncvec.org/page.php?id=358 2011 General Test Pool

http://kb6nu.com/wp-content/uploads/2007/09/2011-No-Nonsense-General-Class-License-Study-Guide.pdf

Extra:

http://www.arrl.org/files/media/News/REVISED_2012-2016_Extra_Class_Pool.pdf 2012 Extra Test Pool

and

http://kb6nu.com/extra-class-easypass-how-everybody-can-be-an-extra/

Note that at the top of each question in the question pool there is a letter in parenthesis... that is the correct answer. For example:

T1A01 (D) [97.3(a)(4)]

For whom is the Amateur Radio Service intended?

A. Persons who have messages to broadcast to the public

B. Persons who need communications for the activities of their immediate family members, relatives and friends

C. Persons who need two-way communications for personal reasons

D. Persons who are interested in radio technique solely with a personal aim and without pecuniary interest < Correct

The answer in parenthesis will not, of course, appear on the tests, just in these question pool study guides.

Podcasts:

http://hamradioclass.com/

http://hamradioclass.com/shownotes/

Practice Tests:

http://www.qrz.com/ham/

http://www.radioexam.org/

http://aa9pw.com/radio/

http://www.eham.net/exams/

http://www.w8mhb.com/exam/

http://www.hamtestonline.com

http://hamexam.org/

Testing Locations

http://www.w5yi-vec.org/exam_locations_ama.php

(Search by State)

http://www.arrl.org/arrlvec/examsearch.phtml

(Search by State, Country, or Zip Code)

Here's what to do... study the study guides a few evenings. Then begin doing the W5DDL classroom presentations. You can do one or two a night.

Also begin taking the practice tests. With all of those sites, each time you take the test it will have a different random draw of questions from the question pool... just like the

real test you will take. I would also suggest you take the practice test on a different site each time. This will help you get used to the appearance of the test being different, just as it will be when you take the actual test. Take two or three (or more if you have time) of the practice tests each night after going through a chapter from W5DDL.

By the time you are finished with the W5DDL classes you will be ready for the Tech test, and you will pass.

BUT WAIT!!! There's more!!!

When you are confident that you will pass the Tech, and are passing by 90% or more, begin study for the General. If you are smart enough to pass the Tech, you are smart enough for the General, too.

With the General comes greatly expanded band privileges. Keep up with studying the Tech guides and the practice tests, but add the General.

You can do this!

Jared, you NEED a copy of FM101x by AC6V. This will tell you the
nuts and bolts of how to actually operate and a bit about how
repeaters work. It is not very useful for studying for the test,
but it is VERY useful for understanding what is actually going
on. If you can't find a copy anywhere else I can sell you one for a
check for $15 plus $4 packing and postage. But I am really not set
up to mail them, so better to find another source. If you have an
HRO nearby, they may carry it.

7223. Re: A/B Switch

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-02 21:32:21 UTC
From: bjeffway@ymail.com
Topic: 7148 Message: 7223

Hi Jim,

Thanks so much for your very detailed reply. Where/how did you learn so much about this radio!? I can't find a real manual anywhere.
It is such a bargen for $70. I bought that plus an arrow antenna at the Boxborough Hamfest and got on satellite for under $200. Works as a marine radio, too.

I read your resonse about 6 times, and I undersatnd much better what is going on. I am running no squelch for the satelites, so that explains why one arrow is always blinking. Menu 7 was set to ON, and 34 was OFF. I changed 7 to OFF and now it works perfectly! Thanks so much.

One more question: I programmed it with CHIRP and display A shows my Alpha, but display B always show the frequency. It's nice to have both the alpha and the freq for the channel you are on, but to change channel you have to select A then use the up/dn then select B and use the up/dn to make them match. Any way to get then to automatically be the same as each other?

Thanks again Jim, you saved me a lot of stress.

Best,
Bob WA1OJN

Paul:

Superb response. Very detailed. I am seeing lots of new hams in the group, probably because of the entry level radio price. I am hoping the admin does not find these threads outside of the group scope.

Should we put this info into the <files> section? You put some effort into the detail. Just a thought. If this is out of group scope perhaps we should start a new group with a link here.

To start let me say hello. My name is Michael and I live in Central Texas. The main reason I picked my UV-5R is because of the price and the fact I can program so many freq.

The problem I have ran into is I can not get CHIRP to communicate with the radio. In fact, When I try to program it, CHIRP will not let me change the make/model. I have no idea what I'm doing wrong and it's driving me crazy. I have installed/reinstalled both the cable driver and CHIRP several times. According to my Control Panel I have installed the correct driver for the cable. Any help would be great! I hope one of you can post up a simple fix for this idiot.

Thank you in advance,

~Michael

Hi Bob
Clarification for you.... what shows in A (upper display) has nothing to do with what is showing in lowers display (or B)
This is a dual band radio giving you the choice to monitor the 2 bands in one radio
As has been described re dual watch etc re-read that part...
You do not need to have the matching name and frequency in upper and lower! This would defeat the concept of dual watch... they are 2 totally separate areas
Other menu options give you the choice to display name/channel/frequency as you choose for each display line... you have chosen name for the top line and frequency for the bottom line - this is not done through CHIRP but through the menu function on the radio - see your user manual

Bob,
You are welcome. To be honest with you, probably more than half the things in my reply to you were learned _after_ you asked the question. I like to help. When someone asks a question, it gives me a challenge to 1) find out what the answer is, and 2) try to reply in a way that is accurate and understandable.

Moving on to you question...

There is no automatic way to keep the A and B displays synchronized. The thing you may not know is you don't have to use the arrow keys to change channels.

Let's say that by one method or another you've selected channel 71 (the channel number is always to the far right of the display when MR/Channel mode is selected) in the A display and you now want to select the same channel in the B display. Here's is how you would do it...

Press the [A/B] key (selects B display)
Key in [0][7][1] (selects channel 71)

Done!

I hope that helps.

73,
Jim KC9HI

Make sure you are using the PL2303 driver which came with the cable... I tried the downloaded All In One and it just hung the software.. also make sure you select the correct drivers for your OS

Thanks, Andy! Perhaps, since this is a group for an entry level radio, and since the UV-5R is a possible route to entry into ham radio, the moderator/owner will allow me to put this in the files section.

Also, I saw this about the UV-3R, posted by a guy named "philip" on Youtube. It's absolutely brilliant... but he was talking about the UV-3R, I had one. Now I have two UV-5Rs, which I think are an infinitely better radio for about $2 more. I paid about $48.50 for one, $65 for the second one equipped with the 3600 mah battery.

So, watch this...

http://www.youtube.com/watch?v=YHd3dZW1SBc

Philip says, "I can get you into ham radio for 80 bucks." He was talking about $50 for the UV-3R and $30 for a ham cram / test session. Well, how about "I can get you into ham radio for 63 bucks." A UV-5R, testing is $14, and I'll give you all the links you need to study FREE.

I will be using this "sales pitch".

You are correct. What Bob is doing is synching the two displays to the same channel so he can see the alpha tag and the frequency at the same time. I do this on occasion my self.

Michael, plug in the programming cable. Look in your computer's Device Manager under Ports. What ComPort is the cable connected to? Remember that.

Now go to CHIRP (similar with the Baofeng software) and when you upload, make sure you have set the same Com Port number.

I do the same thing too. Set the A for alpha and the B for the frequency and then work on the B channel so when I transmit to a repeater I can see the frequency change if there is an offset.

All,

I just bought a UV-5R and have been thoroughly enjoying it. It's amazing to see how far technology has come - I still recall my first HT I bought after becoming a ham about 20 years ago was a used Kenwood TH-215A that cost $220...and only covered 2-Meters !!

I also bought a Baofeng BF-888s (400-470 MHz 16 CH mobile with no keypad), which is where the issue is. I bought it to program with FRS frequencies to allow me to use my UV-5R to keep track of my kids in the neighborhood, but I am having issues finding software to program it (the UV-5R software works fine with my UV-5R, but will not work with the BF-888S). I have found BF-480 software online, but it either is not in English (lots of ???? fields listed so I can't even tell what each field is) or it gives me a virus indication and McAfee will not let me unzip it.

Does anyone know where I can obtain an English version of BF-888S programming software that does not have and virus issues?

Regards,

Pete

CHIRP will not allow me to select my device. I can select the port, COM4. The Make/Model is grey and will not allow me to change/select another. I have installed the driver 3 times from my cheap eBay cable and I have tried the one on CHIRP. I have also installed 3 diffrent types of sofware. None of them have worked. I have gone into the device mgr and confirmend the device is installed and working. I have no idea what the problem is! In the early/mid 90's I was a communications specialist for the Army. You would think I could figure this out.

~Michael

Paul, I can't quite do as well as you, but for folks near San Francisco, I have a study session and test for $20 currently that does all the preparation and testing in 7 hours. We have about a 95% pass rate, which is pretty good. Over 1000 licenses granted.

Michael: I got CHIRP to recognize my UV-5R by doing a download FROM
radio, where CHIRP picks up the radio model from the radio
itself. Give it a try.

Make sure to change the frequency range to match your model exactly, or
you will not be able to enter frequencies or program it properly.

Geoff.

Thanks Geoff.

I tried the link, but still have McAfee stopping it due to detecting "Generic Dropper.fg" trojan. Maybe there is no virus issue at all, but just McAfee being oversensitive?

Use both.

All of the links I listed, but for one, are FREE.

;-)

The keys are, (1) study ONLY the correct answers (all else is there to distract and confuse you) and (B) frequent practice tests to gauge how you are coming along, where your weaknesses lie, what needs more study.

I cannot stress enough that you should also study for the General just as soon as you begin to make some reasonably good scores on the Tech practice tests. Many who have studied for both either passed the General the first time, or came very close, came back the next month and passed.

Some have told me, when I gave them the General test upon grading (and they passed) the Tech, "But... I didn't study the General material!"

Look, if you passed, you are entitled to take the General at no extra cost to you. Anyway, they took the general and came close but didn't pass, missing by only a few questions. So I asked, "Had you at least looked over the materials do you think you might possibly have picked up a few more correct answers?" They replied yes. Well, had they done as I suggested they would have their General tickets.

And the General license is the biggest bang for the buck, giving access to all of the HF bands. And if you think talking to someone across the county via a repeater is cool, just wait until you've had a QSO with someone in Argentina, Spain, Italy, Ireland, or some tiny island you didn't know existed and had to look up on a map. Now THAT's cool!

73,

Paul - AE5JU

Pete,

I see Geoff set you up with the software already. Thanks Geoff.

You might as well take some time to read this blog as well: http://hamgear.wordpress.com/2012/08/11/review-baofeng-bf-666s-bf-777s-bf-888s-and-look-alikes/

McAfee is giving you a false positive. This is also discussed in the above blog. Either turn McAfee off while you are unRARing the file, or replace McAfee with something else. I use Microsoft Security Essentials here.

Dave, $20 for a ham cram is a real bargain. And a 95% pass rate... you are doing it right!

OK, "We can get you into ham radio for 69 bucks!" ;-)

The general test is only slightly harder then the tech test,
and the tech test can be passed by any CBer that has half a
clue about radio. :) Once you get 1000 contacts on your map
at hrdlog.net, it's pretty cool to look at!

I was able to poll my radio! I guess that's a step in the right direction! It still will not allow me to upload to it. I'm going to try and reboot and see if that helps. Now it shows the correct port/device but it won't upload.

Go figure...

>

Use both.

All of the links I listed, but for one, are FREE.

;-)

The keys are, (1) study ONLY the correct answers (all else is there to distract and confuse you) and (B) frequent practice tests to gauge how you are coming along, where your weaknesses lie, what needs more study.

I cannot stress enough that you should also study for the General just as soon as you begin to make some reasonably good scores on the Tech practice tests. Many who have studied for both either passed the General the first time, or came very close, came back the next month and passed.

Some have told me, when I gave them the General test upon grading (and they passed) the Tech, "But... I didn't study the General material!"

Look, if you passed, you are entitled to take the General at no extra cost to you. Anyway, they took the general and came close but didn't pass, missing by only a few questions. So I asked, "Had you at least looked over the materials do you think you might possibly have picked up a few more correct answers?" They replied yes. Well, had they done as I suggested they would have their General tickets.

And the General license is the biggest bang for the buck, giving access to all of the HF bands. And if you think talking to someone across the county via a repeater is cool, just wait until you've had a QSO with someone in Argentina, Spain, Italy, Ireland, or some tiny island you didn't know existed and had to look up on a map. Now THAT's cool!

Hi guys, just received my new UV5R and have been having fun listening in on transmissions. I have noticed that if I go outside I am able to receive more transmissions than what I can from inside my room and would therefore like to set up an antenna outside the house.

I am not really after something huge, just something to have better reception and would like to keep costs to a minimum.

What I have gathered is that the radio uses a SMA female connector but don't know what type of cable i should use etc.

Any ideas, thoughts, suggestions?

Thanks

Michael,
Another fellow was having that same problem just a few days ago and I think I finally duplicated what I believe you are both doing.

The first thing you have to do with CHIRP is "Download From Radio" so you will have a UV-5R template. You'll know when you have a UV-5R template because it will say "Baofeng UV-5R: (Untitled)*" or "Baofeng UV-5R: {some file name}.img" in the template's tab. With out at least one tab with "Baofeng UV-5R:" showing you won't even be able to select "Upload To Radio".

You guys have either created a generic template (File|New) before or after downloading from the UV-5R. I created one and it says "Generic CSV: Untitled.csv" in the tab. If you have the correct tab showing but a generic tab selected, you will be able to select "Upload To Radio" but Vendor and Model will be greyed out. This is normal (and correct).

You need to do all of you editing on a "Baofeng UV-5R:" template. If you have a lot of work in your "Generic CSV:" template and don't want to lose this work, just copy and paste from the "Generic CSV:" tab to the "Baofeng UV-5R:" tab. "File|Export" from the "Geneirc CSV:" tab and "File|Import" to the "Baofeng UV-5R:" tab might work as well. Once you have a good "Baofeng UV-5R:" template, save it to a file (just in case) and then upload it to your UV-5R.

Let us know how this works out...

Good luck and 73,
Jim KC9HI

I don't have one, but there has been some discussion about it in the group. You might check out the N9TAX Slim Jim antenna (variation of the J-pole antenna). You would want the dual band version. Choose the one tuned closest to the VHF/UHF frequencies that you are licensed to transmit on. If it is just for receive only, the frequency range where the antenna is tuned won't matter much. There are also versions that come with 16 feet of RG-58 coax. The N9TAX Slim Jim antennas are also available on eBay.

You'll probably need a SMA-female to UHf-female (SO-239) adapter to hook it up to your HT. You might even look for what is commonly called an HT saver. It is a short length of flexible coax with the appropriate connectors on each end. This helps keep the weight and strain off of the antenna jack of the UV-5R.

If you want to keep your costs low, you might consider a j-pole roll-up. I can give you a contact in California who makes them. He also sells pre-made cable at 6 foot lengths. They are usually made with BNC connectors so you will likely need an adapter which you can purchase just about anywhere.

I agree. My next purchase will be a "Slim-Jim". I haven't figure out how to erect it in the back yard in order to get height. My base station j-poles are in cased in PVC which I can easily install up to 15 plus feet.

> You do not need to have the matching name and frequency in upper and lower! This would defeat the concept of dual watch... they are 2 totally separate areas

> Other menu options give you the choice to display name/channel/frequency as you choose for each display line... you have chosen name for the top line and frequency for the bottom line - this is not done through CHIRP but through the menu function on the radio - see your user manual

The display options CAN be set using Chirp. If you select the Settings display, whose tab is at the left, directly under Memories, then Basic Settings, you will see options for Display Mode (A) and (B). These set whether you view Name or Frequency.
There are a number of other parameters that can be set here, including the all-important Standby, RX, and TX LED colors. Thus far, I have elected to stay with the defaults, but I suspect that I can ward off the bad effect of proximal RF radiation by proper selection of these colors.

what is in between in terms of buildings?

You loose about 3db (1/2 the signal) for each building you have to pass through. There are signal calculators on the web that you can use.

Count each wall, drywall, brick, steel, etc.

3 Blocks doesn't surprise me.

George,
You really didn't give us much to go on. Almost makes me want to ask if they were both turned on and tuned to the same frequency.

How do you know they are configured exactly the same? How did you program them? From the keypad? Baofeng software? CHIRP software? How are they configured?

How about trying this on both UV-5Rs...

Press the [A/B] as needed to select the upper display
Press the [VFO/MR] button as needed to enter Frequency mode
Press the [BAND] button as needed to select the desired band
Set Menu 1 to 2.5K
Set Menu 5 to WIDE or NARR (based on your requirements)
Set Menu 10 to OFF
Set Menu 11 to OFF
Set Menu 12 to OFF
Set Menu 13 to OFF
Set Menu 25 to OFF
Set Menu 26 to OFF
Key in the frequency (make sure they are both exactly the same - all six digits and the "25" or "75" to the right of them if either one is showing)

Now separate the two HTs by several feet and try to talk between them. It should work. If it does, go to your 3-block positions and try again. It should work. If it doesn't, then you have too many objects (hills, buildings, trees, etc.) blocking your line-of-sight path between the two transceivers. If it does work, save this configuration to an empty channel using Menu 27.

I hope that helps,
Jim KC9HI

Ed,

According to many tests that I've seen on Youtube and statements from N9TAX.com do not enclose this anntenna in PVC. I have in the photos section http://groups.yahoo.com/group/baofeng_uv5r/photos/album/644980352/pic/list a few pics that show the breakdown 15' mast for RVing.

When I'm in Florida during the winter I will take the same antenn and suspend it from a tree limb via nylon cord. All works great in my HOA.

I agree. My next purchase will be a "Slim-Jim". I haven't figure out how to erect it in the back yard in order to get height. My base station j-poles are in cased in PVC which I can easily install up to 15 plus feet.

Hi Jim,

OK, understand on the no function to keep A and B the same. The more I learn, and the more I use the radio the more I realize that I don't need that. I guess my thinking on that came from an old Radio Shack scanner I had that used to show the alpha and the freq for the channel. Somehow I assumed this would be the same, but it's actually better the way it is, as you say with the A and B being separate and it actually gives you more functionality that way.

Someone else in the group mentioned the "Settings" section on CHIRP - - didn't realize there was one - I fired up CHIRP and found it - WOW, that's great it lets you set all kinds of things.

Sure enough there is a spot to set A and B to either Alpha or Freq in any combination - that was kind of the thing that made me understand 100% that A and B and totally separate - it's not at all that the top one shows the alpha and the bottom one the freq.

This is the most fun I have had with 70 buck in a long time!!! I'm trying to think of a reason to buy another one!!

Now all we need is for these guys to make a $70 HF rig! Maybe for $100 they could make us a 100W 160-6 all mode!!!

Thanks again to everyone who answered my posts. If I keep working at it maybe I can answer someone myself at some point.

Best,
Bob

This is correct! Good call. You can still use PVC to hang the slimjim, just outside the pipe. It is an awesome antenna for the money. If you want something a little more permanent you could build a "copper cactus" jpole. Very cheap to build and works extremely well. And you can attach it to just about anything or just prop it up in the corner of a room. At the 4 watts of the UV-5R you don't have to worry about RF. but if you get a bigger radio you will want to get the antenna outside.

Kind regards,

Ray

Bob,

As a reason for a second UV-5R I thought that a Red one would look as good as it works..... to justify buying additional units they also come in Yellow, Blue and a Camo version so that you can try to lose one.

Enjoy !

JL

7280. Dual Watch Jumping During QSO

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-03 15:21:35 UTC
From: James
Topic: 7280 Message: 7280

Some of us use the UV-5R for commercial and amateur use. Here is an example to watch. During a QSO there will be two frequencies displayed in the A/B Window. You are talking on B for example and static or a transmission comes in on A. The unit will stay on the last frequency shown, thus you press the button and think you are talking on B and you are really on A due to the blast of static between transmissions or whatever. It is not user friendly to go in and turn of the dual watch before you answer a call. If there is another way, I would like to learn. Just be careful you are talking where you think you are.

James,

Use of Menu#34 controls the channel that you transmit on, that's the most control that you have.

Thanks for that tip JL. That is a good fix. Some may not like the fact you cannot change the frequency in the non transmitting window when using Menu #34, but I like that as it fixes one of my favorite RX frequencies for Dual Watch.

Thanks JIM

If I plan on talking on one frequency I put that frequency in both A/B.
Even if I can control which I TX on I don't want to miss something on my
talking frequency if the frequency I'm monitoring locks a rx signal first.

Topic: 7259 Message: 7286

I have a copper J pole, but for external I'm going with a 1/4 ground plane antenna. All you need is a SO-239 and some solid copper wire. Solder the verticle copper piece (going to be a bit over 19 inches. There are calculators online for exact measurements.) Then, using the four mounting holes on the connector, find a way to attach the four ground radials (which are longer than the vertical around 20 inches)

Bend the radials down at about 45 degrees and it's at 50 ohms and should look like this:

http://www.hamuniverse.com/2metergp.html

I used a .25 inch solid aluminum for the vertical and used old TV antenna tubing for the ground radials. Gotta do more testing, but I am fully quieting the local repeater on 1 Watt. It's perhaps 5-7 miles away. After I mount it high I'm going to see how far I can hit.

73 and good luck on any project you choose

If you find a Low Band rig at that price, stop by and let us know.
We'll start another Yahoo group for that one too :-)

As for owning more than one, I believe you should own one of each color.
Along with having a great little radio, you could make a fashion
statement at the same time.
Just remember not to carry a white
handheld after Labor Day. :-)

Enjoy the Toy...

are you using VHF or UHF?
repeater or simplex?
urban environment or rural?
do you get some range, IE can the radios talk to each other up to the 3
block range?
Also are you using high tx power or low power?

Agreed! The Slim Jim is a fraternal twin to the J-pole, and the N9TAX one works great. You can't buy the materials for the price of this antenna. It is tuned well, no adjustment needed... works out of the box. I have one, and a friend does, too. He works all 10 of the repeaters in his area from inside his house. I've used mine for special events with our club.

A review here, and I find this review is exactly what we have experienced with ours.

http://www.hamuniverse.com/n9taxslimjimreview.html

Purchase here:

http://www.2wayelectronix.com/

Here is the one you want to buy:

http://www.2wayelectronix.com/Dual-band-2m-70cm-Slim-Jim-Antenna-with-16-rg-58-dual-slim-16.htm

Do not put it in PVC.

Personally, I would buy it with the PL-259 so that I could plug into a base rig. Then use the SO-239 to SMA-F pigtail to connect to the UV-5R.

For anyone concerned about RF on the shield from the Slim Jim's "unbalanced" design, there is a ferrite choke bead on the coax just below the feedpoint that takes care of that "problem." You can see it in the photo.

For hiking/camping/etc one of these roll up Slim Jims and a length of parachute cord (with fishing weight tied to the end) to throw over a tree limb and hoist it would be just the ticket. I've ty-wrapped this antenna to some fiberglass (camo net) mast sections, stuck them on a PA speaker tripod and gotten very good performance for some special events.

J-pole (or Slim-Jim)... it does not matter if the mounting stub on the bottom is attached to something conductive, grounded or not, or insulated. I would have thought it would, but it doesn't.

Here is a 2m/70cm J-pole I use at home for my base rig. It is by B-Square Engineering.

http://www.b-squareengineering.com/jpole.htm

It is only $40, made of stainless steel. In the very humid and wet conditions here this is a good thing. And for only $40, for that price I won't buy copper pipe and get out the torch.

Note that in the photo it is attached to a roof vent pipe with a stainless radiator hose clamp. Mine is attached the same way, only to the top of two 10' sections of TV antenna mast. I've filled the socket and plug with silicone dielectric grease and wrapped the coax connection with Scotch 130C (like "coax-seal").

My B-Square Engineering J-pole is nearly 4 years old and has held up well in storms, including the very recent Hurricane Isaac. It is nearly invisible. And for guys in HOAs, just say, "Oh, that? That's a lightning rod. That wire? That's the ground wire, I think. I don't know much about that stuff."

73,
Paul - AE5JU

Of course, if you have a metal file cabinet, you could use a
mag mount 1/4 wave antenna w/ the requisite adapter. I have
some QRM next to my computer but it is fine elsewhere.
And then you could use it on the car when needed.

Dittos to the N9TAX antenna with the "HT Saver" I have 2 of them. And do not enclose them in PVC. The velocity of the plastic causes an swr issue. They are easy enough to hang and N9TAX has great service plus it is an inexpensive portable antenna.

Hi John...

Sure you can.. FRS, 14 channels... pick one...

Channel Frequency (MHz) Notes
1 462.5625 Shared with GMRS.
2 462.5875 Shared with GMRS.
3 462.6125 Shared with GMRS.
4 462.6375 Shared with GMRS.
5 462.6625 Shared with GMRS.
6 462.6875 Shared with GMRS.
7 462.7125 Shared with GMRS.
8 467.5625 FRS use only
9 467.5875 FRS use only
10 467.6125 FRS use only
11 467.6375 FRS use only
12 467.6625 FRS use only
13 467.6875 FRS use only
14 467.7125 FRS use only

Check your country's frequency list if not in USA. My also have Citizens Band coverage in some areas of the world.

Jimmie

And in the US there are 5 Part 95 channels you can use.
The service is called Multi Use Radio Service (MURS). It is a 2 watts output
service so program them all at low power.

o 151.82
o 151.88
o 151.94
o 154.57
o 154.60

The 151 channels are Narrowband so program them narrow. The last 2
are wide but you will find them in use everywhere.

7296. programming a repeater - sorry, I have tried!

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-03 22:02:51 UTC
From: m3mdy
Topic: 7296 Message: 7296

Please can somebody put me out of my misery?

I am trying to program channel 11 on my UV5-R to my local 2mtr repeater, using the CHIRP software. I did manage to work the repeater a couple of times, with the help of a club member, but didn't save the settings, and then overwrote them on the radio :-(

The details I have of the repeater are:
GB3KN, Detling, Kent SE England:-

TX frequency: 145.700 ☐ RX frequency: 145.100
CTCSS: 103.5 Hz or by Tone Burst: 1750 Hz

Not sure it is relevent to these settings, but "The repeater is set to transmit & receive at a deviation of 2.5 kHz. Transmitted CTCSS deviation is 350 Hz."

The settings I have at the moment on the radio are:

Loc: 11
Frequency: 145.700000
Name: GB3KN
Tone Mode: (None)
Tone: 88.5
ToneSQL: 88.5
DTCS Code: 023
DTCS Pol: NN
Cross Mode: Tone-> Tone
Duplex: -
Offset: 0.600000
Mode: NFM
Power: High
Skip:

Can anyone spot where I'm going wrong and kick me the right direction?

regards,
Martyn M3MDY

Sorry, I gave the wrong tone freq - both are 103.5 on CHIRP...

I purchased a 3600 mAhr battery from a Chinese vendor.

Got an interesting note from them.
It said that due to fire hazard, the China Post was no longer accepting high capacity Li-Ion batteries for air shipment.

So the note continued... when you receive the battery from China Post via air, please remove the sticker from the battery that says "Ni-Mh Battery" that covers the originial "Li-Ion" battery information.

Well, that's ONE way to handle it.

Are you sure the mode should be narrow band FM? DTCS should be off or none.
Tone mode should be "on"

Yes, when I programmed my UV-5R, I left ToneSQL, DTCS Code, DTCS Pol and Cross Mode: Tone-> Tone at their default settings.

Are they trying to convince China Post they are Ni-Mh, or
are they trying to convince us they are Li-Ion ?

Things that make you go Hmmm... :-)

Hmmm? definitely!
I wonder if they included a copy of the same note in the packaging, just to be sure?
An interesting take on thinking out of the box... :-)

regards,

Martyn

Don, Jim, Stormcom,

Many thanks for your rapid and helpful responses - I can speak to the world again now! Not too good reception indoors, but I'll be off out tomorrow to try it out!

I'll check what I'm doing more carefully next time - and read the flippin' manual!

Martyn,

I have a feeling you should not be setting a CTCSS tone in the receiver...

I have a 5R, and have PC programmed it successfully on a variety of channels/repeaters, VHF and UHF.

I will be at the BRATS club on Thursday, chat to me then.

What does your BRATS stand for? Mine is the Baltimore Amateur
Television Society. We have a fast scan NTSC TV repeater here.
We know all about the BATC over there!

This may have already been answered- It looks like you have the Tx frequency 145.7 programmed where the Rx frequency should be. You need to program the Rx 145.1 and Tx tone 103.5 and offset 0.6. Program Rx tone OFF for now. The Offset will produce the required Tx frequency.

I don't think so... The Tx frequency refers to the transmit frequency of the repeater (and therefore the receive frequency for the UV-5R) and vice-versa. Also, the OP has reported that everything is now working as it should, therefore the radio has been correctly programmed.

it's 2AM and I laughed so loud at this one when I read it that it woke the YL and the dog up lol.

None of the major package carriers authorize shipment of Li-Ion batteries that are in a charged state either, so the info states that they are not charged upon shipment to the buyer...however, both the 3600MA and the stock 1800MA batteries were both fully charged when me and the boys got them. My 3600MA battery lasted 6 days with fairly heavy usage both tx and rx...probably something like an hour a day of tx, and perhaps 6 hours of rx...amazing stuff...and it's not even supposed to be at max capacity until after the third recharge.

hey, they put "toy" on the shipping label, why not a alternate battery sticker to get the thing shipped?
great stuff

Hi Scott,

BRATS (where I come from, at least,) is "Bredhurst Receiving and Transmitting Society"

http://brats-qth.org/

Bredhurst is a small Kent village, a few miles from the aforementioned repeater.

I've only just rejoined after an absence of about 8 years, and was surprised to find another club member on this group! I shall try and get along to the next meeting to say "hello" in person!

When I said I can talk to people, I can at least trigger the repeater (I have two UV-5s - with the same configuration, I can hear the repeater morse signature on the other when I key the mic), but I'm not entirely sure I'm getting much audio through the repeater. I can hear myself when transmitting simplex from both HTs, but that's at a range of about 3 feet, and nobody has responded to my calls so far...

A little more experimentation and "self-training", methinks!

Regards,

Martyn

I seem to remember the OP is in the UK. In the UK all repeaters are supposed to be 12.5kHz narrow band.

See also: http://harriscountyares.org/training/KNW/KNW-109.pdf

Ed Fong also sells a version in PVC at HRO, dunno the details but you
could ask them.
Ed teaches antenna theory at UCBerkeley EE dept.

I stand corrected. If you make a "U" shape out of the pipe and secure it to the ends of the "U" you will not encounter the velocity issues with the PVC.

Thanks for pointing this out.

File Save As does not work. File Save does work but can be confusing. Hit the Save button, then select correct drive, folder you want to save to, and filename.dat- replace the * with a filename. Nulity says 'did not save' because there was no filename.

Michael,
You have to type in a name. The full name including the ".dat"

Example: MyChannelSetup.dat

yeh, set them all to zero, off.
the only time you might want to use them is if you have a really loud
squelch burst on your repeater...then it'll help to clean it all up...but
setting them all to off or zero insures you hear everything as soon as you
release the ptt.
nice feature for rx only though.

Well, I thought I had it all figured out. Last night/early this morning I was able to download FROM the radio to my PC. So, I spend some time today getting my freq list together and in CHIRP. I get the data all entered, hook the radio up to the data cable, go to install and, it didn't work. I keep getting an error message, handset is not responding. I'm about to pull out what little bit of hair I have left.

So I delete and reinstall both the driver and the latest daily builds of CHIRP. Plug everything back in and the same thing happened. Over and over again. I like the radio but for the time I have spent messing with this, I should have ordered the ICOM. I don't know what to do or what I'm doing difrently than last night to cause it not to work.

Help, again!

~Michael

Make sure the radio is in memory mode when you attempt the upload or you will get the error message.

I find that with CHIRP it doesn't much matter. [A] display, [B] display, frequency mode, channel mode, it all works.

It is another story with the Baofeng software. If you aren't in channel mode and the [A] display, your chances for data errors skyrocket.

See what I mean. You would have had problems no matter what brand of radio was at the other end.

You're not the only one that has had this problem. There are apparently some really crappy cables out there. I'm glad you got it sorted out.

Happy to hear of your good fortune. The cable has led to many of the problems and frustrations with this radio. I think that Baofeng would do themselves a great service if they added $5 to the cost and added a good cable.

Enjoy & good luck on your test.

That's one of the best ideas I've heard today. Especially since there's no keypad interface to program alpha tags.

Topic: 7341 Message: 7341

I have a new UV -5R radio. I am trying to set up the radio to monitor 3 counties ems and fire depts. I've tried to enter the three frequencies and scan the channels in memory to no avail. I had it working on another uv5r but had to return because of defective charger. What am I doing wrong. After 5 hours I'm at wits end. Any help will be appreciated. Thanks

> just receive at this time. i'm totally lost. i've tried everthing.
> i'm not much of a techie. can you help me. i've been at this for
> almost 12 hours. i would really appreciate it. thanks greg

Greg, it is the Daily Build version of Chirp that supports the UV-5R.
You'll need to go here to get it (for Windows):

http://trac.chirp.danplanet.com/chirp_daily/daily-20120811/chirp-daily-20120811-installer.exe

I have a Mac, and the deal is the same: update to a specific driver,
and install the daily build of Chirp. It is the cable that is defective.
I haven't seen a link to a non-defective cable. (Oddly enough, this
other RS-232 USB serial cable I have started working after installing
this driver. Seems a common problem.)

7347. baofeng software does not update radio

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-05 04:52:03 UTC
From: uofa1978
Topic: 7347 Message: 7347

Received the Baofeng software disk (no instructions) and I have put in my repeater frequencies and used the options panel to input with offsets of .600 for vhf and and 05.00 500 for UHF and the ctss tone codes, the step to 5 and the sft-d to + for my uhf and the sft-d to - for my uhf...when I try and read to the radio, it looks like it takes it but when I go to my channel mode, the offsets are wrong, the step is wrong etc....

I am very frustrated...can someone please tell me wtf is going on??

7351. Re: External Antenna..DIY

Hi guys, thanks for the suggestions!

After looking at some of the suggestions, i think i might head of in a different direction to start off with and get myself a car antenna that i can put outside the house and when i feel it, attach to the car.

Depending on how that goes, and if i'm still interested i might go onto creating a more permanent solution. I kinda feel overwhelmed by all these options...

With my car antenna option, will a smaller size antenna make much difference to what i get with the radio and its antenna inside my car? I don't what to get a big antenna as it wont look right on my car.

Regards

The portable Mag mount antenna is a good idea. Any antenna outside of the car will show great improvement to the stock antenna. A 5/8 wave antenna will have the best "gain" for the radio. This will allow you to use low power and still have the range you need to hit repeaters etc..

The UV-5R uses the RX and TX frequency to program a channel. SFT_D and Offset on the Optional Features panel have no affect on programmed channels. They are used in Frequency Mode only.

You have to do the math...

For a 146.640 -.600 repeater:

RX = 146.640
TX = 146.640 - .600 = 146.040

You enter 146.640 in the RX Frequency column and you enter 146.040 in the TX Frequency column of the Channel Information panel.

For a 444.900 +5.000 repeater...

RX = 444.900
TX = 444.900 + 5.000 = 449.900

You enter 444.900 in the RX Frequency column and you enter 449.000 in the TX Frequency column of the Channel Information panel.

It is the same for everything else (TX Power, W/N, etc). If it is on the Channel Information panel, it is ignored on the Optional Features panel.

The A & B Band Frequency Mode sections of the Optional Features panel are only used when the UV-5R is in VFO/Frequency Mode.

Tip: Always set "CTCSS/DCS Dec" to OFF

I hope this helps.

Hi guys

BIG problem.. .

My 1 Month old 5R packed up earlier.
All working OK this morning, now on switch on it only displays the incons the display is capabile of ie the battery, vox, R, N, S and so on.
Will not go to normal display, radio is still working ok though, oddly!!

Tried a reset, but without a display I cant see what Im doing!!!

Any Ideas?

BTW just waiting a call from my UK supplier (Sinotel)

You can use a metal file cabinet, large cookie sheet or even a 18" pizza pab to "stick" the mag antenna to. Doing this will provide better results than one gets from the rubber ducky.

I have no interest or gain but my mag antenna came from Import Communications http://www.uv-5r.com/ it works equally well on 2m/440. It has a BNC connector so you will need the sma/bnc adapter to go with that which they offer also.

Good luck,

JL

John,

There have been some display issues after a disassembly. Not that you took yours apart but perhaps this is the issue especially since you said the unit works. There was a fellow a while back that said hi worked from a cold start but malfunctioned once warmed up.

Can you confirm that the keypad functions and the China girl talks to you?

Transmit and receive OK?

I would guess that an exchange would be the best for you since youo have your supplier at hand.

Please keep us posted.

Hi JL & Jim

Yep Just trying the battery off it now.

@ JL

Yep
All fuctions seem ok, TX is ok - RX is ok too.
Rig speaks to me!
I can in a sense still use it, as I know where I put our local repeaters and so -on!

Still awaiting call back from Sinotel. . . . .

73's both

Did you Delete the channels to clear them before programming? If there is anything in a channel location, your manual programming will appear to work but it will not be saved. Delete the desired channel number and then program that channel. Manually programmed channels have Scan On by default.

Now that explains a lot. You're not interested in learning how to
program this radio from a ham radio point of view, nor are you
interested in getting your computer set up to program it.

Both are frequent and hot topics here.

IMHO the best thing you could do is to post your general location, and
if there is someone one this list near you, they can do it for you.

If they already have a computer set up and working, it is a five minute job.

John brings up a great point. Why, oh why, oh why did Baofeng put SO much effort into design of a very neat radio, and then not beta test it with 10 or 20 of us and use our feedback? We could have told them: Be sure your case mouldings are clean with no flashing around the speaker and cable holes, be sure to include a first-class cable, be sure to involve CHIRP as a tester and give them a dozen free radios as a thank you, etc. They obviously spent thousands of man hours on design, a dozen man hours on testing would have done wonders.....

You might want to try TeamViewer. You can download a free copy here:

http://www.teamviewer.com/

This software works like some of the customer support sites you have
probably visited.

Each person downloads a copy and it allows one person to "sit at" the other
person's computer just like he is in the room.

I believe the current version is TeamViewer 7.

Thanks for the input...but I am still not understanding...I switched to chirp and downloaded my 8 radio frequencies already set up in the UV5R, added 98 frequencies with their downloaded specs from Repeater Book, and uploaded them all back to the radio.

When I go to frequency mode, my settings for my main repeater are all correct, when I go to that same frequency in channel mode (where I just uploaded all 106 channels), my offset is back to "0".

So, why in channel mode is it different and I cannot talk because settings are changed on the upload??

thanks for you help

Say, Smokey, I guess this shows firemen know how to flame! Too bad you didn't utilize the excellent information in this group before buying a radio more suited to a hobbyist than a consumer. Having worked in tech support for the past 22 years, you are a shining example of a user I would never take on as a client. Sell the $50 toy and buy a big boy radio for 8 times the money that suits your needs. I'm sure one of your comrades in the fire service can recommend a radio that can be manipulated without opposable thumbs. Please be forewarned it will come with a manual full of multisyllabic words that you will need to be read to you.

Have a nice day.

When in Channel Mode, SFT_D and OFFSET are nut used. It doesn't matter what they are set to.

In Channel Mode go the the [A] or [B] display (the one that is still set to show the frequency). Then switch to the channel programmed for your repeater. The received frequency for the repeater should be in the display. Now tap the [* SCAN]. The display will be in 'reverse' mode and the transmit frequency should now be showing.

A suggestion, can you email us a copy of your saved file as you've programmed the radio. Maybe we can spot a problem there.

You might want to try TeamViewer. You can download a free copy here: http://www.teamviewer.com/ This software works like some of the customer support sites you have probably visited. Each person downloads a copy and it allows one person to "sit at" the other person's computer just like he is in the room. I believe the current version is TeamViewer 7. ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ ☐ Bubba seys, "Howdy" KK4HGY Check out http://www.wethepeoplenation.com -------Original Message------- From: Gregory Demarse Date: 9/5/2012 11:36:38 AM To: baofeng_uv5r@yahoogroups.com Subject: Re: [baofeng_uv5r] Re: Setup I'M NOT SURE WHAT YOUR IMPLYING BUT I HAVE ATTEMPTED TUTORIALS AND AND PROGRAMMING TO NO AVAIL. Now that explains a lot. You're not interested in learning how to
program this radio from a ham radio point of view, nor are you
interested in getting your computer set up to program it.

Both are frequent and hot topics here.

IMHO the best thing you could do is to post your general location, and
if there is someone one this list near you, they can do it for you.

If they already have

Wow, that was harsh. But where there is smoke...

The UV-5R is a great radio. Frankly, one of the best values that I have seen in an amateur radio. There are WAY more people that own them than are members of this list that all use them just fine, everyday, all day. Honestly, I had mine running in about 30 minutes to an hour. It is the radio I use everyday. It is sitting beside me here at work right now.

The other posters are correct. The UV-5R sucks as a scanner. It is can also cause you potential problems as a scanner unless you figure out how to block transmission on the channels you do not have transmission privileges on. And yes, you will accidentally or otherwise press the PTT button. It happens. And if you do it enough times, people in a uniform will come looking for you. There are ways to prevent transmission on a memory frequency, but given the problems you already have, you have a long way before you are even crawling, let alone walking.

This is a hobbyist radio. Amateur radio is a hobby. (Ya, Ya, I know there are bunch of people using it "illegally" on GMRS/FRS and the like without the proper licensing. We get it.) There is a certain level of exploration and learning required. If you want hand holding, clearly written manuals, and technical support, go to radio shack and buy a scanner.

You bought a cheap wrench and want to use it as a jeweler's hammer. Not saying you can't, but it is going to take some time to figure out the finesse required to make it work. You are either up to the challenge, or you are going to continue to yell at people on the list? Figure it out. Sell it, and get your money back, and go buy the right tool for your goal. Or, go back to square one. There are so many tutorials, both in the files site for this group, and on youtube for this radio now.

Good luck!

Subject: Re: [baofeng_uv5r] Re: Setup

Wow, that was harsh. But where there is smoke...

The UV-5R is a great radio. Frankly, one of the best values that I have seen in an amateur radio. There are WAY more people that own them than are members of this list that all use them just fine, everyday, all day. Honestly, I had mine running in about 30 minutes to an hour. It is the radio I use everyday. It is sitting beside me here at work right now.

The other posters are correct. The UV-5R sucks as a scanner. It is can also cause you potential problems as a scanner unless you figure out how to block transmission on the channels you do not have transmission privileges on. And yes, you will accidentally or otherwise press the PTT button. It happens. And if you do it enough times, people in a uniform will come looking for you. There are ways to prevent transmission on a memory frequency, but given the problems you already have, you have a long way before you are even crawling, let alone walking.

This is a hobbyist radio. Amateur radio is a hobby. (Ya, Ya, I know there are bunch of people using it "illegally" on GMRS/FRS and the like without the proper licensing. We get it.) There is a certain level of exploration and learning required. If you want hand holding, clearly written manuals, and technical support, go to radio shack and buy a scanner.

You bought a cheap wrench and want to use it as a jeweler's hammer. Not saying you can't, but it is going to take some time to figure out the finesse required to make it work. You are either up to the challenge, or you are going to continue to yell at people on the list? Figure it out. Sell it, and get your money back, and go buy the right tool for your goal. Or, go back to square one. There are so many tutorials, both in the files site for this group, and on youtube for this radio now.

Good luck!

7391. HELP!!

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-05 17:19:01 UTC
From: John
Topic: 7391 Message: 7391

As an addtion to my last posts.

I got no call back on the phone, told they were busy each time I called.

I have now emailed them explaining the trouble.
The 5R is STILL working!!

So I now await an email or maybe a phone call . . .

73' John - G8CAU

I went thru thesame frustation1
Tried several drivers and CPU's.

Finally I jammed the cable into uv5r stiffly, fully seated.
Tried to cpu and Tada, it worked perfectly.

Late I read someone mentioned a problem with
plugs not fitting well.......

My 2 cents,   gud luk!!

Some kind soul pointed out I had a typo in the text below. Thanks. I should have read...

You enter 444.900 in the RX Frequency column and you enter 449.900 in the TX Frequency column of the Channel Information panel.

Are the cables actually made by Baofeng, or are they purchased
and packaged with the UV-5R by the different distributors we buy
from? I remember a mention that one of the distributors had
cables with their name molded in the side. I assumed that
Baofeng didn't see the need to manufacture a cable that was
already widely available for a few other radios.

I've seen a couple of comments here to take a question to
the CHIRP forum - what's the link? I was unable to find an
active one. Chirp works well with my UV-5R, but can't
communicate with my Yeasu VX-3 using a just received
programming cable. Wondering if theres some trick setting
of the rig before deciding the cable is bad.

>added a good cable.

John brings up a great point. Why, oh why, oh why did Baofeng put SO
much effort into design of a very neat radio, and then not beta test
it with 10 or 20 of us and use our feedback? We could have told
them: Be sure your case mouldings are clean with no flashing around
the speaker and cable holes, be sure to include a first-class cable,
be sure to involve CHIRP as a tester and give them a dozen free
radios as a thank you, etc. They obviously spent thousands of man
hours on design, a dozen man hours on testing would have done wonders.....

Mag. mount car antennas are usually designed to work in conjunction with the metal of your vehicle on which they're mounted. The mag. mount may work outside without being on your vehicle by putting it on a round metal pizza pan or similar.

FYI- For applications where a metal ground plane is not available, the Diamond NR770 is a long Dual Band that is designed to work without a ground plane. I have a NMO mount version and it is a good antenna.

Truly a case of "if it don't work, get a bigger hammer" :)

I also had the usual beginner problems, drivers, etc. Finally
got to the point where it would sometimes work if I pushed the
radio cable connector in the right direction. Then one day
I pushed hard, heard a POP, and the cable plugs in and works
without a problem now. I've been plugging in connectors for
more than 60 years - thought I knew when one was fully seated,
but apparently something was preventing proper connection.

Only trick now is that the radio has to be downloaded into CHIRP
twice - first read always fails.

oh don't worry, once you put an antenna on your car, you'll love the look of it, and it'll be a short while before you'll want to put more on there.
Of course, most of us are required to recognized the "WAF" rule, which is Wife Approval Factor.
I simply put the additional antenna on the vehicle, and wait for her to notice...sometimes it's a week or two before she even notices there is another appendage on the roof lol.
If it takes that long for someone who drives the vehicle all the time to notice, no one else is going to notice it as you drive by either.
Of course, we drive a ford explorer, so the only people who see the roof are truckers and 4x4 types with jacked up trucks.
I have friends who drive toyota hybrid cars, and they typically stick something on the trunk or top lip of the hatch back.
if you are concerned enough, just use a quarter wave dual band type antenna...19 inches long or so and doesn't stick out as much as say a 5/8's wave which is 40 inches long.
MFJ has some small mini mag mounts that work better than a stock antenna inside the vehicle as well.

You can use a metal file cabinet, large cookie sheet or even a 18" pizza pab to "stick" the mag antenna to. Doing this will provide better results than one gets from the rubber ducky.

I have no interest or gain but my mag antenna came from Import Communications http://www.uv-5r.com/ it works equally well on 2m/440. It has a BNC connector so you will need the sma/bnc adapter to go with that which they offer also.

Good luck,

JL

Subject: [baofeng_uv5r] Re: External Antenna..DIY

Hi guys, thanks for the suggestions!

After looking at some of the suggestions, i think i might head of in a different direction to start off with and get myself a car antenna that i can put outside the house and when i feel it, attach to the car.

Depending on how that goes, and if i'm still interested i might go onto creating a more permanent solution. I kinda feel overwhelmed by all these options...

With my car antenna option, will a smaller size antenna make much difference to what i get with the radio and its antenna inside my car? I don't what to get a big antenna as it wont look right on my car.

Somewhere between 1 antenna and this:

http://www.cardomain.com/ride/2630240/1985-plymouth-colt#2630240_1

Can probably be set as the "acceptable range".

Cheers!

RD

I hope he's insured the heck out of his car. The radio equipment has to
be more valuable than the car.

Michael,

I'm having a similar issue - could you be more specific as to which side of the cable did you open - closer to the radio or at the USB connector?

I solved the Wife Approval Factor.
It took a little coexing, but now that she has HER license,
you can't imagine what I get away with. :-)

I don't know why there would be a problem with a 5' copper j-pole strapped to your car bumper. ;-) But since you insist on going this route, check out this thread...

http://www.eham.net/ehamforum/smf/index.php?topic=44422.0

It looks like a round piece of metal (as in the metal pizza pan suggested previously) is suitable as a ground plane substitute for your mag mount antenna inside the home. I saw 19 and 38 inches, round, mentioned in the thread. Or, you could make radials with wire. You could even just use wire window screen. (Needs to be real wire screen, not the plastic stuff, obviously.)

Cheers!

RD

I guess the best way to sell a new radio is to give it a
familiar name.

Enter the Vitai UV5R

http://vitai.en.alibaba.com/product/606466588-212219107/New_Arrival_VT_UV5R_Dual_Band_Portable_Radio.html

Those buggers will clone ANYTHING...

I used to have a long wire antenna for shortwave stretched over my house, from a tree in the back yard to a tree in the front. One day my wife noticed it. "That's ugly, it ruins the look of the house, take it down immediately!"
"Deb", I said, "... it's been up there for the last 1 1/2 years." She found it difficult to argue her position at that point. :)
Sorry for the off-topic post.Ian

oh don't worry, once you put an antenna on your
car, you'll love the look of it, and it'll be a short while before you'll want
to put more on there.
Of course, most of us are required to recognized
the "WAF" rule, which is Wife Approval Factor.
I simply put the additional antenna on the vehicle,
and wait for her to notice...sometimes it's a week or two before she even
notices there is another appendage on the roof lol.
If it takes that long for someone who drives the
vehicle all the time to notice, no one else is going to notice it as you drive
by either.
Of course, we drive a ford explorer, so the only
people who see the roof are truckers and 4x4 types with jacked up
trucks.
I have friends who drive toyota hybrid cars, and
they typically stick something on the trunk or top lip of the hatch
back.
if you are concerned enough, just use a quarter
wave dual band type antenna...19 inches long or so and doesn't stick out as much
as say a 5/8's wave which is 40 inches long.
MFJ has some small mini mag mounts that work better
than a stock antenna inside the vehicle as well.

Antenna..DIY

You can use a metal file cabinet, large cookie sheet or even a 18"
pizza pab to "stick" the mag antenna to. Doing this will provide better
results than one gets from the rubber ducky.

I
have no interest or gain but my mag antenna came from Import Communications
http://www.uv-5r.com/ it works equally
well on 2m/440. It has a BNC connector so you will need the
sma/bnc adapter to go with that which they offer also.

Good luck,

JL

.
Many of life's failures are

Hi guys, thanks for the
suggestions!

After looking at some of the suggestions, i think i might
head of in a different direction to start off with and get myself a car
antenna that i can put outside the house and when i feel it, attach to the
car.

Depending on how that goes, and if i'm still interested i might
go onto creating a more permanent solution. I kinda feel overwhelmed by
all these options...

With my car antenna option, will a smaller size
antenna make much difference to what i get with the radio and its antenna
inside my car? I don't what to get a big antenna as it wont look right on my
car.

Regards

The little plastic housing around the USB end is what I opened up. In it you will find 3 wires connected to the board. On mine, 2 of the 3 came loose. I pulled the stop sleave back a little where there was some slack in the line then resecured the wires to the board. I then put the plastic housing back on and wrapped with elect. tape. I will go back and glue it together. I didn't want to glue it last night in the event I had to open it back up.

I hope this helps!

~Michael

See what I mean. You would have had problems no matter what brand of radio was at the other end.

You're not the only one that has had this problem. There are apparently some really crappy cables out there. I'm glad you got it sorted out.

Chris,

We do try to help folks here that are from many countries, skill levels, needs and uses for this radio. If it gets too much for me I just kick my 95# Pit Bull and suffer the consequences.

I found out that "sometimes nothing is the best thing to do" . Applies to Pit Bulls and @#$% holes.

opened, checked with the multi-tester, cable is good. could be contact at the receiving female connector (smaller) on the baofeng side. I probably can open the radio, but I'm not sure if that gonna expose the contact properly for me to check...

Most if not all Yaesu radios must be set in "Clone" mode before up/downloading...I'm not familiar with the VX-3 in that regard...check your manual.

From the Chirp FAQ:
"Should I put my Yaesu radio into clone mode first?
Yes, Yaesu radios do not respond to commands over the serial port and must be manually manipulated. Start CHIRP with the cable plugged in and the radio in the intermediate clone mode (usually entered by powering the radio on with one or more buttons pressed). When downloading from the radio, put CHIRP into download mode (where it is waiting on the radio) before initiating the clone out from the radio. When uploading, put the radio into clone receive (or clone wait) mode before initiating the upload from CHIRP."

I disagree

How do we know that the chips that we are trying to use were correctly licensed by Proflic??? They are not the bad guy here. The chinese that cloned them are the bad guys.

Most to the ham community only uses FTDI chipset for RS232/USB communications because the Prolific chips have been illegally cloned.

While I can understand the frustration and emotion involved, I'm afraid the fact is Prolific is entirely within their rights. They produce software drivers to allow users to operate their hardware products, not someone else's, and certainly not illegal copies of their own proprietary goods.
Asking them to "support" illegally cloned chips would be a little like asking your local bank branch to open an account for your counterfeit cash. They have no such responsibility and it is counter to their interests.
The villain here is the manufacturer of the copied chips, who has probably not paid proper and appropriate royalties to Prolific for "borrowing" their design, and who has obviously not written their own drivers for you to use--they simply expect you to use the drivers Prolific has already written. Prolific has said, in effect, "nuts".
As tinkering geeks we have hammered out a work-around, but copyright and patent law is on Prolific's side on this one, I'm sorry to say.

Well OK you made your point, concerning copyright of proprietary goods. However, let it be known I personally and speaking only for my self halve never heard of a business called Prolific. Honestly, If I had known that Prolific was the best on the market and this (software cable)was there specialty, I most surly would have sought them out.
Finally: If I am in a business say for example that manufactures and sells proprietary cables and software then I would be wise to make sure that no one else can steal my secrets my patents and my design. There are laws in place all over the world to protect a company such as Prolific and if they are so ignorant of the law that protects them then to hell with them. You are presuming that Prolific has been wronged on this issue but there are to many laws in this modern day world to protect Prolific. Therefore they must take most of the responsibility for this issue. KJ6khf Frank Beaumont Calif.

7429. Got cow sound (background) when Tx and Rx Test !!!

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-06 06:42:14 UTC
From: yusairi
Topic: 7429 Message: 7429

Hi Members,

I got a problem with my set of baofeng uv5r handy and my mobile antenna.

Whenever I try to transmit, people shall Rx my voice with background sound like a cow (animal).

I'm using handy model Baofeng UV5R and my antenna model is Super Gain S7200.

Spec of my antenna :

SG7200: 144/430MHz(2m/70cm)(300MHz receiving only)
Length:0.96m / Weight:335g
Gain:3.2dB(144MHz), 5.7dB(430MHz) / Max.power rating:150W FM(Total) / Impedance:50ohms / VSWR:Less than 1.5:1
Connector:MP / Type:1/2wave C-Load radialless(144MHz),2x5/8 C-Load radialless(430MHz)

Here is my test scenario :

1. My Handy Baofeng UV5R + My mobile antenna = TX & RX Not clear with animal sound like a cow.
2. My Handy Baofeng UV5R + other mobile antenna = TX & RX Clear.
3. Handy TYT (dual band) + My mobile antenna = TX & RX Clear.

Need some advice to resolve my test #1 scenario.

Thanks.

7430. Squelch Adjustment

Hi, is there anyway to tighten-up the Squelch Adjustment any more than the menu settings allow? Like a maybe internal trimmer pot? Its hard to impossible to squelch out the noise at times.

From: Colin McDonald
Topic: 7430 Message: 7432

the squelch on VHF is pretty much on or off with very little to no change between 1 and 9.
UHF is a little better, but not by much.
I suspect this is a firmware issue and there won't be much you can change inside the radio beyond perhaps a cap or resister value to tighten the squelch...it is digital squelch as well which doesn't react the same as analogue squelch.
I've noticed the same thing as you. Especially on VHF. My uv5R tends to chatter allot almost like a pulsing noise but quickly.
I simply move the radio a little bit or stick my hand on the antenna and it goes away...this on the stock duck so far.
I haven't had an opportunity to use a non-stock antenna on the uv5r yet.
Speaking of that, the stock UV5R antenna is horrible on VHF.
I'll upload an antenna sweep analysis to the files area for everyone to see.

use a different antenna.
problem solved.
a strange one though no doubt.
Too bad it wasn't a pig noise, would be much more appropriate for ham use
lol.

Not the best solution, perhaps, but Nagoya makes an antenna mount that clips over the top of a side window glass. It has a BNC mount for the antenna and a plug of your choice for the radio. Can't remember the model no but I'm sure you can find it on eBay.

Perhaps you got a bad one? The two I have (one for the UV-3R+ and one for the 5R) are as good if not better than the antennas provided with more expensive radios.

Sounds like the particular combination of antenna and UV5R is allowing RF to get back into your radio. This could be happening via the coax or through the air. I guess you could try some ferrites on the coax to see if that might solve the problem. Another solution might be to add a longer section of coax to the antenna (to get more distance between the antenna and the UV5R).

.... or simply use a different antenna!

Good luck.

For new people who just want to program their radio- Do not get wrapped around the axle over the Prolific issue. Just use the already documented procedures and correct driver and program your radio. The issue of Prolific drivers and chips is far beyond our sphere of influence and the problem has already been resolved for those who read and follow the guidance in this Group. It is very unfortunate that those outside the Group may wind up chasing the problem, but we can't solve that problem.

I would check with the author of the software you are running.

Why do you need the frequency unlocked? Mine isn't locked.

Guys,

Let's kill this now. It is way off topic and there is no way for us to fix it.

There are many know options to get your cable function. Just search the FAQ or the archives.

Every ham web site and mobile antenna article I read says do not use glass mounted antennas because of the passivated glass used in modern vehicle safety glass. And yet, I see glass mounted antennas everywhere on late model cars. The clip onto the glass thing is not any better because then there is no ground plane under the antenna. Drilling holes in your car counter-intuitive and gives the "heebee jeebees" to just about everyone. Hardly anyone wants to do that, and yet in this case it is the most ideal solution.

But again... anything that gets the signal outside the car is better than a rubber ducky inside the car.

I am rolling through all these scenarios in my head because I just purchased an FT-8800 and am currently trying to figure out mounting options for an antenna on my Explorer. Up until now, I have been using a mag mount antenna on the roof with my UV-5R. Having even a small mag mount on the roof made a huge difference. I know in my head that drilling a hole in the roof of my vehicle is the best option. I just can't bring myself to do it.

Good luck with all that. I still don't know what I am going to do. For now it will continue to be the mag mount for me.

Drilling holes in the roof isn't as scary as you'd think. My mobile antenna is a Tram. don't recall the model at this moment.
Anyway, just drop the headliner, pick your spot and drill. NMO is pretty sweet. No worries of pinching off coax. None is exposed outside the car. With a mag mount, moving it will eventually scratch the paint. I just figured I'd drill a hole and be done with it. Plus if I swap antennas I just swap them. Cords already run.

In the past I have had good luck with a "L" bracket and an NMO mount on an Explorer (and other vehicles). The "L" bracket can be attached to your vehicle with a few screws in a location where two panels meet... usually either the hood or the trunk. The screws are out of sight when the hood (or trunk) is closed and difficult to notice once removed. The coax can usually be routed to your rig easily.

How do you know it isn't transmitting?

What does the displayed frequency show when you are transmitting?

Do not use the magnet mount on the refrigerator, transmitting while mounted on the refrigerator could cause the beer to go flat!

Cheers, Ian

I have seen those. That is also an option that avoids the damage one of
those lip mounts can cause. Definitely worth giving a second look.
Thanks for the reminder.

I have a Diamond NR770HNMO Dual Band and a NMO Mag Mount on my GMC Envoy. I simply route the coax through the rear door front top gap and then down the door post to the passenger front seat. Works just fine. If I used my rear door a lot, I would probably have to replace the coax where it passes through the door gap, but so far it has lasted over a year. The Diamond is a neat antenna with reasonable gain, less than 1.5 SWR over both bands and a tilt capability if you have a low garage.

What happens when you test on a simplex frequency?

Make sure the radio you are receiving on does not have any CTCSS/PL or DCS
code to open the squelch.

Or, make sure the radio your are transmitting on is sending either the
right CTCSS code or right DCS codes.

The big problem with many conventional antenna solutions is that they rely on a ground plane.

A 1/2 wave end fed antenna does not need a ground plane, and for two metres, is a metre (and a bit!) long. The matching network is a parallel tuned circuit, resonant at two metres, with one end of the coil to the co-ax outer, and the other end to the antenna. The co-ax inner connects part way up the coil.

Theoretical figures for performance are 0dbd. A 5/8 loaded antenna has a theoretical gain of +3dbd. But it needs (and probably won't get) a decent ground plane. I'll go with the half wave end fed any time there is the slightest doubt re the ground system available.

I have a 1/2 wave for 70cms that I used on the 5R. And a home made 1/2 wave (practical, with care) for 2 metres. Performance was very good.

1/2 wave on a glass mount will work very well indeed, so before discounting an antenna, check to see if it is 1/2 wave at the operating frequency..

HTH,

73 de Stan, G4EGH

Thanks Mike. I appreciate the heads up.

Since the CHIRP daily releases are in essence beta software, my recommendation is to use the latest CHIRP daily that adds a feature for or fixes a bug related to the UV-5R. Scrolling back through the activity log still takes me back to v20120730 where Bug #262 was squashed. So that is still my recommendation to UV-5R users. That the version that I use.

There's nothing wrong with updating beyond that. You just won't gain anything by doing it.

the simplex frequencies are coming over my scanner, but not my other radios. i am thinking maybe its a dpl programming issue on the baofeng?

Does the red TX LED light up when you press the PTT or do you just hear a quick 'beep' sound?

You might upload you CHIRP .img to the group (just temporarily) so that one of us can take a look at it. It might help us to pinpoint the problem quicker. Or if you would rather send me a personal message, I will reply with my email address and I will take a look at it personally.

It is a PL or DCS coding problem. There is a Wiki that explains how PL and Digital Coded Squelch works. Short story, is the numbers have to match.

You'll have to get the correct codes for the commercial radios.

If the receiver does not CTCSS or DCS setup to keep it's squelch closed until the correct code is received, then it shouldn't matter if the UV-5R has a TX CTCSS or DCS code setup or not.

However if your other HTs have their RX setup for CTCSS or DCS, then they aren't going to 'hear' the UV-5R until the UV-5R is setup to sent the correct code.

Topic: 7259 Message: 7464

if you have a good ground plain, IE, a 19 inch circle out from the antenna, a mag mount works as well as any hole mounted antenna...with RF, especially on say a 5/8's wave antenna, you don't need a DC ground...it's a coupled RF ground, which, to the antenna, looks the same as a direct dc ground to the metal of the vehicle.
A mag mount is absolutely no compremise for a mobile antenna.
if you are trying to put it on a smaller vehicle with less ground plain, or on the trunk of your car or something, then it may not work as well as something bolted directly to the body, but the difference will be very tiny indeed.
I have run both body mounted, and magnet mounted antennas on the same vehicle and there is no difference in performance.
I have an explorer as well, and a 5/8's dual bander slapped into the middle of the roof works extremely well.

if you really want to drill a hole, put it right above the dome light in the cab. Easy to get at from under neath...and easy to run your feedline from that point down the B or C posts.
Who's going to see the hole if you ever take the antenna off?
You fill it up with some kind of automotive sealant, slap some paint over it and no one would ever notice except maybe a very observant truck driver looking down at it.
our vehicle bodies are full of factory made holes already, what's one more for an antenna?

Every ham web site and mobile antenna article I read says do not use glass mounted antennas because of the passivated glass used in modern vehicle safety glass. And yet, I see glass mounted antennas everywhere on late model cars. The clip onto the glass thing is not any better because then there is no ground plane under the antenna. Drilling holes in your car counter-intuitive and gives the "heebee jeebees" to just about everyone. Hardly anyone wants to do that, and yet in this case it is the most ideal solution.

But again... anything that gets the signal outside the car is better than a rubber ducky inside the car.

I am rolling through all these scenarios in my head because I just purchased an FT-8800 and am currently trying to figure out mounting options for an antenna on my Explorer. Up until now, I have been using a mag mount antenna on the roof with my UV-5R. Having even a small mag mount on the roof made a huge difference. I know in my head that drilling a hole in the roof of my vehicle is the best option. I just can't bring myself to do it.

Good luck with all that. I still don't know what I am going to do. For now it will continue to be the mag mount for me.

RD

Hi Frank....

Wellllll, that would be like locking up the victim in a crime instead of the perpetrator.

They have a right to protect their business and intellectual property. If you want to use the latest drivers from them, buy a "bonafide" cable with the Prolific chipset. But then that is probably harder than we think.

US defense department is having problems with Chinese knockoff parts and assemblies. If they can be screwed, so can we. Of course, we could always send the "Terminator" after them, since he is currently without a job.

I don't recommend mounting an antenna on the hood lip or on the front fender.
The reason being is that you don't have a proper horrizontal ground plain for the antenna when you mount it there. Therefore, the antenna becomes rather directional. Also, you've got the entire bulk of the cab behind the antenna, so if you are trying to talk to anyone located behind you, you'll see much poorer performance.
A mag mount right in the middle of the roof on the X will actually be your best antenna placement.
If you do a search on
HTTP://www.explorerforum.com
for antenna mount you'll get all kinds of pretty cool and creative methods of mounting anything from a small quarter wave ham antenna up to a 9FT cb whip on an explorer.
I've used up to a tripple 5 inch mag mount with a ham stick on it without difficulty.
that in itself isn't vehicle specific, but the x has quite a bit of real estate on the roof, so it makes for a great ground plain.

I have seen those. That is also an option that avoids the damage one of those lip mounts can cause. Definitely worth giving a second look. Thanks for the reminder.

In the past I have had good luck with a "L" bracket and an NMO mount on an Explorer (and other vehicles). The "L" bracket can be attached to your vehicle with a few screws in a

location where two panels meet... usually either the hood or the trunk. The screws are out of sight when the hood (or trunk) is closed and difficult to notice once removed. The coax can usually be routed to your rig easily.

Gee, Ray, then don't do it! Nothing wrong with running a magmount, just have to watch out for theft.

You might want to stop by a CB website or dealer and see what they are offering... there are alternatives.

Ask some of the car dealers that do a big leasing business what they're customers are doing under similar circumstances. No holes allowed in leased vehicles!

Call the sales guys at Amateur Electronic Supply in Milwaukee, and talk to them. Find out what other hams are buying... they have an 800 number. The guys that answer the phones are all hams that have the same problems as you and I.

Yes you can.

Set your RX freqs to say Ch# 60,61,62,63 spaced as you want.
Set your TX in a similiar fashion.

Set Menu#34 to TX on the same channel as the TX freq.
Set Menu#7 to ON.

In Channel Mode start on the lower Channels and increase both RX & TX as needed until Sat is gone.

If there is a RX you should hear it and when you resond it will go to the A/B side for that.

Hope that it was clear, I have done it this way.

Subject: [baofeng_uv5r] UV5R with Satellites?

With the Baofeng UV-5R can I tune the RX freq on 70cm when I'm in cross band mode without affecting my x-mit freq?
That is, TX on 2m, RX on 70cm and adjust this RX freq to allow for satellite downlink doppler shift?
Experienced replies please.
Milt.

I cannot find it. Under the battery I find the model number, an FCC-ID, a CMIIT ID, but nothing that looks like the various serial numbers I have seen posted on this group or anywhere else online.

Thanks,

Aaron

Another thing to check is your car insurance. Some policies don't cover antennas that are not attached.

I know....off topic.

Class action is a bad way to sue companies. If you want to break them
make them pay lawyers for thousands of cases across your country,
individually.
The only real winners in a class action lawsuit are the lawyers who put
them together. They get, what, 33% while you split the rest with
thousands of others.

I found an image showing a serial number in the Photos area. The stickers/labels on mine look nothing like it. Mine looks like:

```
=====================================
BAOFENG
FM PORTABLETRANSCEIVER
MODEL UV-5R
FREQ 136-174MHz/400-480MHz
-----------------------------
! Device must be restricted to occupational use to satisfy FCC therefore exposure
compliance. See owner's manual for specific operating requirements.

FCC-ID: ZP5BF-5R

This device complies with part 90 of the FCC rules. Operation is subject to the following
two conditions: (1) This device may not cause harm ful interference. (2) This device must
accept any interference received, including interference that may cause undesired
operation.
=====================================
EWC ISO9001
CE 0687 ! FCC
RoHS 20
CMITT ID: 2012FP1942
```

Much easier to program channels (I use 5 of them) for rx 5 kHz apart and tx frequency on same channel for the same frequency on all 5 channels. This allows on going Doppler adjustment as the bird passes. Fwiw, I have worked ao-27 and so-50 with this radio although the rx is just marginal compared to the Wouxun models.

Apparently you're unfamiliar with the way things work in China. IP law is flagrantly ignored.

There's not a lot Prolific can do to combat it. Think you can take on China? Go ahead and try.

Prolific has no responsibility to you. They didn't even sell you a driver, let alone provide the pirated chip in your cable.

Mounting an antenna on my old Explorer was a piece of cake.
I found a rust hole in my roof approximately 5/8" in diameter,
sanded it until the metal was shiny, and mounted it there.
No drilling required.

John K3NXU

--- In baofeng_uv5r@yahoogroups.com, "Colin McDonald" <blulemon@...> wrote:
>
> I don't recommend mounting an antenna on the hood lip or on the front fender.
> The reason being is that you don't have a proper horrizontal ground plain for the antenna when you mount it there. Therefore, the antenna becomes rather directional. Also, you've got the entire bulk of the cab behind the antenna, so if you are trying to talk to anyone located behind you, you'll see much poorer performance.

Up until now, I have been using a mag mount antenna on the roof with my UV-5R. Having even a small mag mount on the roof made a huge difference. I know in my head that drilling a hole in the roof of my vehicle is the best option. I just can't bring myself to do it.
>
> Good luck with all that. I still don't know what I am going to do. For now it will continue to be the mag mount for me.
>
> RD
>
>
> Ray -
>
> In the past I have had good luck with a "L" bracket and an NMO mount on an Explorer (and other vehicles). The "L" bracket can be attached to your vehicle with a few screws in a location where two panels meet... usually either the hood or the trunk. The screws are out of sight when the hood (or trunk) is closed and difficult to notice once removed. The coax can usually be routed to your rig easily.

Turn of the HT
Press and hole the [3] key while turning on the HT
This will get you the firmware version.

You can do the same thing with the [6] key but it reveals no meaningful information.

Topic: 7487 Message: 7487

My radio won't let me type in frequencies anymore. Once I type in the last number it says "Cancel". It didn't used to do that. What happened? The only thing I'm doing different is using that CHIRP software to program it.

Hi..

Check with the Chirp group. The author of the software monitors that list.

That happens if you are in the wrong band (for instance, if you try to type in a 2M frequency when you are in the 70 cm band). Press the band button to change the band and try entering the frequency again.

Your problem has nothing to do with CHIRP. See my post above.

Jim, good for you, I'm also a new ham, not yet a month. I applied for my Vanity the same day my license showed up on the ULS, it was issued last Tuesday.

I'm not sure what I'll use my license for yet, probably Public Service in some way.

  Just took the Tech test and passed yesterday. My 5 year old was helping me study by reading out the questions. Last night he asked if we were going to study and I told him that I took the test so I don't need to anymore. He asked if I would test him. I asked him 11 questions and he got them all right! lol I told him we are now going to work on getting him licensed.
he wants to talk to the astronauts.

Cool!

Kids that age soak up information like a sponge. If he rolls through the questions and answers a dozen times or so he'll be ready for the Tech exam.

My youngest is 12. He passed his Tech and General (he did General at Dayton during Hamvention) this spring. We're (the club) doing an exam session late this month and he's going to try for extra (I'm not confident that he'll pass that).

We'll see.

This is great! Congratulations on getting your ticket.

One thing you can use it for is a exemption from Indiana's silly scanner law. Public service is good. Down here in Bloomington I am most active during bad weather. Quite a few of us are weather spotters. I have channel 0 programmed to the local NOAA All Hazards radio so it is always handy.

Mike, is it necessary to uninstall an older version of CHIRP prior to installing the new one? Or will this simply install "over" the previous version?

I'll never do weather spotting. Where I live I can not much. I'll never go out an sit someplace in my vehicle as my wife is disabled. If the weather is that bad, I need to be here with her.

I do a lot of local events with my GMRS license, I'm sure hams do some as well.

Hi JL

I am suggesting that they expand their list of subject matter experts by also joining the Chirp reflector.

I am not sending them away at all. Just sending them to the right resource. Here, we discuss issues with the radio, the modes, radio settings.

It is easy to join that list at http://intrepid.danplanet.com/mailman/listinfo/chirp_users.

It was an issue with the radio not with Chirp.... that was the 2nd time you've done this and I think that all it does is confuse the person in need.

Out of four units we have bought, two E-Bay, one Hamfest and one MTC Paris Texas, the MTC Radio is the only one with a serial number. On the top of the registration page it says something about buy from a local dealer. I would say we would have a hard time getting one replaced from China. On the other hand, the one from Texas for another $20.00 looks like you can return it for replacement if the card is filled out and attached to their invoice. The place for a stamp or seal, don't know what they want there. Most I have talked to say for $50.00 they will throw it away and buy another. Buyers choice.

Mine will be 6 in a month so I doubt he will make the youngest. How impressive that anyone that young could take and pass the test.

Congrats to you as well. I am not really sure what I will be doing with my license. I do fly RC planes and originally I wanted to use the license to be able to transmit telemetry data and fly the planes in a first person view with a camera aboard but not really sure I want to do that. I kinda like the way I fly right now.
I was considering a vanity but want to see what my call sign will be before I start considering it.

That actually sounds pretty interesting to me. Weather spotting would be rather boring here. I am in Southern California and around here there is breaking news if it starts to sprinkle. I lived in Southern Indiana for a while, have some family there too.

Topic: 7470 Message: 7516

I bought mine in March from 409shop (via eBay) and it has a serial number in the battery compartment (right under the bar code).

I've been following this group since March and there have been a few that have successfully gotten their Hong Kong dealer to exchange their defective UV-5R. Most only have you send back the HT, I think I remember seeing the cost at about $8.75 and they send back a complete package. The real down side is the length of time it takes.

Read the thread starting at message 2343 to read about someone that has actually done it.

http://groups.yahoo.com/group/baofeng_uv5r/message/2343

I gotten way over $50 of enjoyment from my UV-5R. If mine broke and I couldn't fix it myself, it would get recycled.

Good luck,
Jim KC9HI

If you are interested in learning more about weather forecasting and events, contact your local NWS office. go to <http://www.weather.gov/> and use the map to get to your local office.

They offer a program called SkyWarn Spotter training, 2-3 hours with a focus on severe weather events (hurricanes, tornados, T'storms, etc). Much o the training is in the Spring and early Summer, but they have classes throughout the year.

Depending on your politics, it is either free or we have paid for it already.

Being a ham is not required, although about 3/4 of their spotters are.

Spotters observe weather at their location, usually their home, and report in via a radio net, email, or phone. Those taking the training have the choice of how much they will participate. Some use a personal weather station.

I also recommend this training to people who spend time outdoors, be it hikers, skiers, fishermen, boaters, as a way to understand local weather and avoid problems.

I just bought a new cable from canlan2012 off ebay. Dead from the start.

I've plugged it in on 2 Win7 machines and neither indicated that anything had been plugged in.

I left the thing plugged in to one of the machines for several minutes. When I unplugged it, it was VERY hot.

I sent email to the seller and they have offered to replace it or refund. Now I'm waiting to see if they want me to send it back.

We'll see.

I did notice the driver cd had drivers for the Prolific chipset so I assume that is what this is supposed to be.

73 DE NO0OO.

probably a factor of the awful swr on VHF with the stock antenna.
Bring the SWR down to a reasonable level, and you get far more power out of the antenna and thus you can get into repeaters you were barely able to kerchunk before.

Folks, I live in an apartment. No where to put weather equipment outside, would get stolen even if management would allow me to install it.

While I have taken NWS weather spotting training in the past, I've never used it. There are plenty of other spotters within a short distance of where I live. I have no large trees around me. The only thing I might ever encounter would be a power line down or transformer on fire.

I'm sorry but my first responsibility is to my wife. Neither of has family within a two hour drive and no friends within a half hour drive. We take care of each other.

Subject: Re: [baofeng_uv5r] Re: New ham

  If you are interested in learning more about weather forecasting and events, contact your local NWS office. go to <http://www.weather.gov/> and use the map to get to your local office.

They offer a program called SkyWarn Spotter training, 2-3 hours with a focus on severe weather events (hurricanes, tornados, T'storms, etc). Much o the training is in the Spring and early Summer, but they have classes throughout the year.

Depending on your politics, it is either free or we have paid for it already.

Being a ham is not required, although about 3/4 of their spotters are.

Spotters observe weather at their location, usually their home, and report in via a radio net, email, or phone. Those taking the training have the choice of how much they will participate. Some use a personal weather station.

I also recommend this training to people who spend time outdoors, be it hikers, skiers, fishermen, boaters, as a way to understand local weather and avoid problems.

I posted this before, but I got my UV-3R and UV-5R programming cables from eBay seller radioshop888, same seller where I bought my two UV-5Rs.

I plugged in the cables, my Win 7 64-bit laptop loaded drivers for them automatically, and when I plugged in the radios they were both able to communicate once I set the ComPort.

Probably not. Unless you had the correct (read older) driver and somehow caused it to be updated to a new driver that refuses to work with the counterfeit chips. The newer driver could have been offered in Windows Update or plugging the cable into a different USB port can trigger an update. In either case, going back to the working driver would return the cable back to working order.

It appears that many of the cheap cables are cheaply made. There have been server reports lately that have revealed that the wires that come from the radio end of the cable are very poorly soldered to the circuit board at the computer end of the cable. These wires are becoming disconnected after a while causing the cable to fail. Purely a hardware failure and not caused by drivers.

Earlier on, I made a recommendation that some users may find less frustrating, especially if you are wanting the true plug and play experience.

Purchase a 'name brand' USB/RS232 adapter from Walmart. The reason you want to use Walmart is that you can take it back if it doesn't work. With XP, Vista and Windows 7 (32 or 64) you have a very very high chance of this adapter working first time/every time. You plug it in and you can then see your serial or com port in Device Manager. And, as I said, if it doesn't work, you can take it back simply for one that might. No muss. No Fuss.

If you are lucky, you'll even get one with the FTDI chip set which does work ALL the time.

Purchase the RS232 programming cable. I believe they make them in 3:1 and 8:1 so you can program all your radios. That cable is about the same price and would plug into your RS232 cable of course.

Most of my friends went this route and we have not found a bad RS232 cable programming cable.

It is very clear (to stay on topic) that the Prolific chip that the Chinese use is a clone. In case you are not aware, the Chinese take pride in stealing IP (Intellectual Property) and reproducing it. They even boast about it. For those that have done work with them on a daily basis, they can confirm this. Sadly, I have seen it happen to my RFID business and several other business associates have lost significant money and IP to them.

Then again, you pay $8 for a programming cable that Icom, Kenwood, Yaesu or even RT systems charge $45 for. You pay your money, you take your chances.

Carry on.... :)

Well my nearest Walmart must be over 3,000 miles away and I can't imagine Asdas would have one. Anybody in the UK know where to source these to make the same cable here? How does this USB/RS232 adapter connect to the UV-5R?

The replacement cable from eBay 'nicheone' hasn't arrived from China and they said they will send yet another one (3rd) from their UK warehouse. I don't want to break that so I need to make sure that the drivers are correct.

Hi,

Any computer store in the UK (sorry, I thought you were in the US) will have one. Amazon UK has them (http://www.amazon.co.uk/USB-RS232-Converter-Cable/dp/B00077DJIQ). PC World would certainly have them. Amazon will only sell stuff that works. It is not in their interest to sell something that they have to take back.

I also see that Amazon sells the USB programming cable http://www.amazon.co.uk/USB-programming-Cable-Baofeng-UV-5R/dp/B0083H56MY/ref=pd_sim_sbs_ce_5,
but I wonder if they are the fake or real Prolific chip set.

The USB cable you guys are all fighting with is a series of converters that gets you to RS232. Something that is very old and trusted. RS232 are those connectors that have 9 pins on then. Often called a DB9.

The USB/RS232 cable has a DB9 while the RS232 programming cable also has a DB9 (just the other sex).

So, what you get now is a non-cloned adapter that will work (the hard part), and a very simple programming cable that does not require any software drivers.

RS232 only needs 3 wires. Ground, TX (talk) and RX (listen). There is some voltage conversion (RS232 to TTL), but you don't need to worry about that.

You might find you already own one if you have any other Ham equipment around that you are using (the RS232 cable that is).

I hope that helps. That is why I have been say all along, don't order the USB programming cable.

If you use Ham Radio Deluxe at all, you will see that every ham there has been told NOT to use any cable by Prolific as they cause the problems everyone is seeing. The preferred cable is FTDI. The minute my group of friends saw the USB cable, we knew they would be trouble.

I hope that helps, Mike va3mw

This guy sells UV-3R cables made using a different bridge chip, and
Chinese "Kenwood" cables from the UK.

If you can't get past the driver problem, you could buy a UV-3R cable
from him and add the "Kenwood" (UV-5R) connector to it. Possibly by
buying a Chinese cable and moving it.

<http://www.uv3r.com/>

I have no connection to him, except some correspondence and being a
satisfied customer.

Geoff.

I'm not positive about exactly what you're planning there, but be careful.
The "USB-to-the-Radio" cable has the USB-to-Serial smarts in the USB end. A "USB-to-Serial (DB9)" cable typically has the conversion chip in the DB9 end. (At least the one I have does.)
Make sure you don't end up with 0 or 2 conversions going on.

I believe you'll have this trouble with many USB serial adapters. I
bought one from TrendNet (totally unrelated to my UV-5R), and it has the
same problem as our El Cheapo programming cables.

After installing the serial driver (on my Mac) for the UV-5R
programming cable, my TrendNet usb serial cable started working. It has
a similar chip, but not the same one.

There are tons of really crappy hardware for PCs around. I have
received many boxes of random PC parts and cables from people, and I
troll Goodwill. It really is hit or miss on some of these devices,
unless you use Linux - most wacky hardware will work with Linux with a
little tweaking.

Hi Ian

I can explain it in great technical depth, but the point is, there is no double conversion here. It is the exact same solution to a problem.

The USB cable you buy is USB to RS232 (ie: com 4) to the radio.

There is no double conversion. You are right about the USB to DB9 part as that is comes out as RS232... RS232 is what the radio wants to see at the right baud rate, etc. There is no conversion from the RS232 (6-071 output) to the adapter to the radio.

When you do it in this way, you are doing it in the same number of steps, just with 2 cables instead of one.

My RS232 programming cable from 409shop says:

6-071
Com Programming cable Adapter for K/FDC

I then plug 6-084 Programming adapter KPlug into my UV5R.

And, it came with 8 adapters so I can hook it up to just about any radio from Kenwood, Icom, Yaesu, etc. Including my UV5R

My 6-070 USB programming cable did NOT work (as in Plug and Play) on my Windows 7 boxes. It might have worked on my XP box, but I never tested it. I get a Error 10 that we all know about.

[image: Inline image 1]

I hope that helps.

7542. Help with Split Frequencies Using Chirp

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-07 14:59:09 UTC
From: James
Topic: 7542 Message: 7542

When entering a repeater such as 154.000 RX that has an transmit frequency of say 159.000 TX I have been entering
DUPLEX SPLIT
OFFSET 159.000
When I go to save this, the software changes it to:
DUPLEX +
OFFSET 6.625
What am I doing wrong?
Also on digital squelch for both RX and TX
TONE MODE DTCS
DTCS CODE 246
CROSS MODE??????
There is a Arrow then DTCS or DTCS then the arrow.
What is the meaning? WHat do you use for DTCS RX and TX

Thanks in advance guys, I could not find an explanation.

73 JIM

Hi Jim

I just tried a non-standard split and it worked for me.

Duplex was Split.

(Manually, that would be a +5).

I was on the this weeks daily build.

I would jump over the Chirp users group and ask Dan there. He responds pretty quickly. If it is a bug, you can enter a bug on the web on his web site.

http://chirp.danplanet.com/projects/chirp/wiki/FAQ might help you out.

7544. front end too much gain

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-07 15:27:42 UTC
From: tarroeira
Topic: 7544 Message: 7544

I have noticed that when an external antenna is used uv-5r blocks itself (Vhf and UHF). It seems that the front end shows too much gain, good to be used with the pigtail but not with other antenna with more gain.
Probably there is a fet in the input with too much amplification just to be used as a portable device but not connected to a better antenna.
This happened to me and to a couple of friends.
Does somebody in the list experience this problem and found a cure?

Regards
Al

Hi Al

You have landed on the problem with the RF front end and why this is a $50 radio.

In the radio world, we say the front end is as "broad as a barn door".

In a better made radio, they incorporate band pass filters that are adjusted while the frequency is tuned. I would have to guess that there is not a tunable front end on this radio.

Do you live in a high populated urban area? If that is so, you might want to build your own VHF bandpass filter. That will help.

I have used my UV5r with many antennas (rubber ducks to big repeater verticals) and never ran into that. Something just doesn't add up.

Yes. I would crack open the plastic and unsolder the cable from the board.

Geoff.

Hi Mike
yes you are right about cheap front-ends, (living just in the middle of a populated city.......)
I have been thinking about the bandpass filter, but the problem is in both Vhf and UHF.....

Hi David,
we were using 7 ele beams (at 60ft) so antenna gain is a little bit more than a vertical.....

When the front-end is not fully block the radio signals obtained will be distorted.
Apart from that it works perfectly.

Al

Hi Mike,
I think I already understood what you're saying. It's good information. Let me paraphrase it back so you can tell me if we're on the same page,...
The common, (and troublesome), cable contains a USB-to-Serial converter which does the same basic thing a USB-to-Serial cable does, converting USB levels and protocols to RS232. It just terminates differently. So with a working driver in place for this cable the PC sees a virtual COM port, but the all-in-one cable terminates with the physical fitting(s) ready to plug in to the UV-5R. (And hard, don't we all know,...)
The solution you champion requires two cable parts. The first terminates in a DB9 RS232 connector, giving your PC an actual COM port you can use for any legacy serial device. That's handy to have, since serial ports are drying up as original equipment on PCs. (A driver is involved to make it work also, but being a different chipset it is not problematic.) To this generic cable you add a 2nd "dumb-as-a-post" serial cable to mate with the radio.
What I'm not sure of is what exactly G8VKB was planning do regarding "chop off the USB end and use both to get one working cable". ??? Chop off the USB end of which cable, and marry which two parts together? It matters, for the reasons you point out.
That's what I meant by potentially ending up with 0 or 2 conversions instead of 1. Both of the methods described above perform only 1 actual "conversion". But dicing & splicing cables has to be done with this in mind lest you create a hydra.
I hadn't made myself clear. Hope I haven't made it worse.Ian

Hi Ian
I can explain it in great technical depth, but the point is, there is no double conversion here. It is the exact same solution to a problem.
The USB cable you buy is USB to RS232 (ie: com 4) to the radio.

There is no double conversion. You are right about the USB to DB9 part as that is comes out as RS232... RS232 is what the radio wants to see at the right baud rate, etc. There is no conversion from the RS232 (6-071 output) to the adapter to the radio.

When you do it in this way, you are doing it in the same number of steps, just with 2 cables instead of one.
My RS232 programming cable from 409shop says:

6-071Com Programming cable Adapter for K/FDC
I then plug 6-084 Programming adapter KPlug into my UV5R.

And, it came with 8 adapters so I can hook it up to just about any radio from Kenwood, Icom, Yaesu, etc. Including my UV5R

My 6-070 USB programming cable did NOT work (as in Plug and Play) on my Windows 7 boxes. It might have worked on my XP box, but I never tested it. I get a Error 10 that we all know about.

I hope that helps.

They do sell VHF and UHF band pass filters, but that is really not a practical solution for 3rd order harmonic overload on a $50 radio.

As for everyone else, your results will vary based on your proximity to high power pagers, FM radio stations, etc. It is all about front end mixing and when 2 frequencies get a chance to mix, you also get the some and the difference of their frequency.

This is an age old radio communications problem. The radio is working as designed. The front end is as broad as a barn door.

You can attenuate your received signals, and this can help as any attenuation has as logarithmic impact on the intermod you are hearing.

Good luck, Mike va3mw

Oooookay, that makes sense. Just replace what was there with the same that works, a little cheaper than a new cable(s). Thanks Jim.

Ian,

I believe G8VKB was talking about getting an FTDI USB to RS-232 adapter breakout unit with solder hole for the RS-232 signals. Cut off and throw away the bad (USB) end of the cable and solder the wire in the proper positions of the breakout. That should leave you with a one piece cable that should work.

Ok Thanks Mike, I will try that. I have an uneven split, i.e. point 865 RX
and point 860 TX, but I will see what happens.

Thanks for the reply and info.

Manually, you would:

Enter "+" for the SFT-D (shift direction).
Enter "05.000" as the offset instead of 159.000.

So, using CHIRP, you would probably:

Enter "+" for DUPLEX and "5.000" for the offset.

Dave Schultheis
WB6KHP San Jose

I don't use CHIRP, but I haven't seen any other answers, so this is
something you can try while you're waiting for an expert to respond.

The USB cable issue is a pain, as you have figured out.

***** This is the best plug and play method there is ---- But you have to spend a few more $$$ --- Time is Money *****

Last week, I posted a solution that works. Go to Radio Shack, Best Buy, etc. and buy a standard USB to RS232 Cable. The ones they sell are supported to work, out of the box, with just about everything most of has. True Plug and Play. You plug it in, you hear the ba boom windows sound and it pops up saying Com 4 (as an example is available).

Remember that number.

Next, you buy the RS232 programming cable for your radio. Not the USB one. Or, you can even make your own (if you are the type).

Plug that cable into your working RS232/USB adapter you bought at Best Buy. It it didn't work...take it back and get one that does.

Tell Chirp to use COM 4 (as in our example).

Voila! Bob is your Uncle.

Program away......

excellent.
so this clasp lock issue seems to be pretty common from the messages I've
read so far on it.
But an easy enough fix with a fine file appropriate for plastic and
attension to detail should fix it up perfectly.
You'll seriously enjoy the uv5R like pretty much everyone else who has
bought one does.

Look on truckers store. They have good cb brackets. I used one for that. It doesn't get out well as there's no ground plane the way I mounted it but fine for car to car.

the model number is j0125A.
I bought two from saleseshop on ebay.
They have shipped but I haven't received them yet.
Just go to ebay and do a search for j0125a.
It will come back with something like universal female sma antenna for kenwood TKxxx, wouxun, puxing and so on...they won't usually state they work for a baofeng uv5r, but as long as it's a female sma antenna it will work.

probably a factor of the awful swr on VHF with the stock antenna.
Bring the SWR down to a reasonable level, and you get far more power out of the antenna and thus you can get into repeaters you were barely able to kerchunk before.

this is a little odd...though not totally unexpected.
you are using a 7 element beam at 60 feet, so your forward gain is probably
something close to 14DBi?
this might be too much for the uv5r to easily handle and it will overload
causing the problems you described.
I have found most HT's, no matter their cost and manufacturer, tend to
overload to one extent or another when used with very high gain antennas.
You could check into a VHF/UHF attenuator that would offer say 10DB of
attenuation.
Then again, I strongly suspect that if you have a 7 element beam at 60 feet,
then the uv5r isn't the main radio you are going to be using on that
antenna.
stick with a rubber duck or a mobile antenna and you'll see excellent
results.

Where does the $3.79 antenna come from? Just as an FYI, I put the stock antenna (embossed) of my last purchased UV-5r on my antenna analyzer and it was about 1.4 at 146 MHz. However, the stock antenna of my first unit (not embossed) bought back in May was up over 2.5 at 146 MHz but about 1.5 at 139 - 140 MHz. It appears that things have improved with the stock antenna.

It's not onlt radio users thathave this problem, I found this link:

http://www.ifamilysoftware.com/news37.html

very useful in resolving the issue of trying to use the wrong (newer) drivers with the pirated connector cable I ended up with.

Since using this, I've not had any trouble with connecting to either of by UV-5Rthe connecter cable. Easier that chopping cables up, sendingthem back (or to the trash) and quicker than ordering a replacement, and cheaper than getting a guaranteed, genuine, branded version!

regards, Martyn M3MDY

7576. UV5R: Differences between rtonefreq and ctonefreq

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-07 20:52:30 UTC
From: fischelb
Topic: 7576 Message: 7576

What is the meaning of these two file columns? Is one the transmit CTCSS and the other the receive?

Also, in the tone column, some of the import files have the term TSQL, and others have the term Tone. What is the difference?

7577. Re: [baofeng_uv5r] UV5R: Differences between rtonefreq and ctonefreq

From: Colin McDonald
Topic: 7576 Message: 7577

tsql is your receive tone. IE, the signal you wish to receive must have
that tone in it for the radio to receive if you have it enabled.
"tone" is the uv5r transmit tone...IE, if the radio or repeater you are
trying to talk to requires an input tone, your radio must transmit the right
tone frequency.
Rtonefreq is receive tone or tsql, and ctonefreq is for tx.
A hint, do not program a rtonefreq or a tsql into the radio unless you
absolutely need it due to intermod or noise.
It isn't required to receive a signal even if that signal has the tone in
it.
The only time you absolutely need a tone is on the uv5r tx if the other
radio or repeater needs the tone on it's own receiver to retransmit your
signal.
Part of the confusion here is in the terminology used.
You will hear both tx tone and rx tone refered to as ctcss, pl, tsql and
tone interchangeably.
On the UV5R itself, in the menus, it designates Rctcss for receive tone
squelch, and tctcss for transmit tone.

If you used this guide, you must only be using CHIRP. In my extensive driver testing I've found that the driver supplied here is v3.3.2.102, is the highest version that will work with the cloned chips. It will work with CHIRP but it won't work with the Baofeng software. For the OEM software, the driver version has to be dropped back to v3.2.0.0 to have any success.

Tone, PL, CTCSS TSQL are all the same thing.

If the Receiver is programmed with TSQL of 100hz, then the Transmitting station has to transmit it in order for the receiving station to hear the conversation.

Some repeaters require TSQL to run on the repeater.

However, you don't need TSQL programmed to receive a signal.

Why you ask?

Commercial operators may have several customers on 1 repeater pair. Customer A may have a tone of 67 Hz. Customer B 103.5 and Customer C 156.7hz. Neither can hear the other, but it is a party line, so only 1 customer can use the repeater at the same time. Radios are then programmed to NOT transmit if the repeater is in use.

I hope that makes sense.

Colin and I collided with answers.

Next DCS or Digital Coded Squelch is the same idea, just a different technology.

Hello All

I just got my UV-5R in the mail today..can someone help me set up the radio so I can at least monitor on both vhf/uhf? I will not be transmitting until Monday but would like to make sure this thing works.

Appreciate the help in advance!

409 shop and some ebay sellers claim a 4000mAh Li-ion Battery

The model is indicated on the inside as "BL-5" the text
description shows "2-118";
that seems to be differnet from the 3600mAh battery.
A real capacity increase, or just new numbers on the same battery?

I could be wrong, but I don't think you are going to find this IN a Walmart. You would have to order online and do a pick-up at your local Walmart. Just google walmart usb rs232 and you will get the links to them on the walmart web site.

7597. uv5r newbie -- quick question

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-07 23:47:04 UTC
From: Guy Teague
Topic: 7597 Message: 7597

greetings to the grp. i am slowly wading through the messages, files, and other web pages.

the uv5r has 'replaced' a malfunctioning yaesu vx7r which (truth be told) wasn't used very much anyway. my apartment sits beside dfw airport and is a morass of rfi--i'm reduced to using the internet and an iphone app for most of my 'scanning'. but, i've been a ham many years and would be lost without some sort of radio to hand--at least for emergencies. i plan to use the uv5r in conjunction with a uniden bc125a scanner with close call function. the wideband capability of the uv5r will be used for a workplace channel, frs, and gmrs.

i got the radio from ?sainradio? via amazon for $55. i also got the programming cable (i think it's the ?wouton? one which was more expensive than the cheapest one offered on amazon, but came with free and faster shipping and i think i dodged a bullet because while i was waiting for the cable i started reading on here about some cables not having the proper chipset.

i run vmware fusion windows7 on an imac and i installed the chirp software into the vm image and it recognized the radio with just a little tweaking. as with anything windows, i am always grateful when anything works at all!

anyway, sorry for the long introduction, i'll post my firmware version and details for the spreadsheet that's going around when i get off work next week and have some time.

my question is that i uploaded a batch of frequencies to the uv5r from chirp including about a dozen 70cm repeaters with pl-tones and offsets. on chirp these showed as 5.0 and '+', but on the radio my display shows '+/-'. when i hit the 'scan' button the frequency changes, eg: from 443.500 to 448.500 and when i go into the menu the offset is set for '+', but i can't figure out why my display shows '+/-'. when i programmed a repeater manually before i got chirp working, the display only said '+'.

tks,

/guy (73 de kg5vt)

The +- display just means an Offset is being used. When you Tx, the proper Tx frequency should show in the display. Same if you tap the Scan (Reverse) button.

thanks john!

i guess the gist of the (long-winded) question was why the difference depending on whether you program it manually (only shows a single '+') vs via chirp where it shows the '+/-'.

i'll have to confirm that manual part again to refresh my memory next time i get some time to mess with the radio, but i'm pretty sure it was as i remember.

Guy,
Welcome to the group. This got asked last Saturday. Unfortunately you can't search using "+-". Maybe there should be a [plus] and [minus] in the message so at least "plus minus' would work in search. Anyway read message 7173 for a more detailed explanation.

http://groups.yahoo.com/group/baofeng_uv5r/message/7173

I throws hams off when they have always used +/- and offset as long as they can remember and then the move to an HT that doesn't. It makes it worse that the HT has menus for them both. Talk about confusing...

Guy,

You're right. With >7600 messages, the Yahoo! Groups web interface leaves a lot to be desired.

I joined the group when there was something like 250 messages. That makes my searching a little easier to do because I know the information I'm looking for is there. That gives me a edge when choosing search terms. When you don't know what you don't know, choosing the right search terms for the question that you need answered can be next to impossible to do.

I'm here (as well as many others) to help. I don't mind searching for answers to questions. By pointing you back to a previous message, I didn't mean to imply that you should have searched for the answer yourself. My only goal was to keep from repeating an existing answer that I felt was already an adequate answer to your question.

73,
KC9HI

I have just received two of these that I ordered a few weeks ago.

http://www.ebay.com/itm/271010902869

Regardless of the "15 cm" length listed, it is about 8-1/8" not including the SMA threads. By comparison, the Nagoya NA-701 is right at 8", not including the SMA threads.

I've got the NA-701 and it works very well, noticeably better than the stock Baofeng antenna.

I have just today received these J0125A "Female Univeral Antennas for... (lots of radios)" and have just tried an A/B test against NA-701 through the local repeater about 4 miles away, from here at my desk in my home, and back to another ham about 20 miles away.

He reported that the NA-701 as full quieting, good clean audio. The J0125A he reported as having some noise in the audio.

We had previously determined that the NA-701 was far superior to the stock "rubber ducky" Boafeng antenna. I have not yet compared on air the stock UV-5R

So, it looks like as in all things, you get what you pay for.

you didn't mention if this testing is done on VHF or UHF or both?
a repeater four miles away? you should be hitting it so strong that no one should be able to tell the difference between antennas.
Unless you are setting to low power or something to help with lowering your signal a bit to obtain a more accurate test.
I find that testing HT antennas works best if you are marginal into the repeater to begin with.
if your going to have a60 over S9 signal into the machine, it's much harder to get accurate results and feedback etc.

The picture shows 4000.

The 3600 hasn't been out all that long. The jump from 1800 to 3600 made sense. 100% increase.

3600 to 4000 is only around 11% increase. I don't understand the logic in designing a battery with those numbers, unless its just as simple as adding another cell into the existing battery case. I don't know.

But then, I don't understand the logic in a lot of things.

7612. programming cable problems

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-08 05:18:01 UTC
From: bluesky462000
Topic: 1896 Message: 7612

Hi Everyone
I just want to share this I to have had my share of problems with the USB programming cables. This is what i did. Instead of using a USB I bought programming cable with the 9Db serial plug. I'm using a wouxun programming cable and the Baofeng's programming software and never had a problem. Ok now for anyone that wants to really get the USB cable working try this.
one uninstall the proflic driver and reboot
now once the computer come back, Insert the USB cable and WAIT
this migh take a few minutes, watch the screen.
once it say that the usb device has installed correctly you should be good to go and then use BAOFENG's software to connect to the radio if you can download (first) make a change then Upload then try to program using Chirp, I did manage to get my USB working but I Never had to install the driver in Win7 x64. XP might need the driver.

The funny side to cable issues. I have three cables. All work with varying degrees of extra wiggling connections but the work with my UV-5R and Wouxun's. But none will work with my Kenwood TK-3160 which uses Windows software. I have to dig out an old Windows 98 machine and use a serial cable. But also CHIRP won run on the Win 98 computer.

I'd wager it's the same battery, they are just expressing its capacity in Chinese milliamps, which are a bit smaller than Western milliamps!

My guess on the 4,000mah has 2 possibilities.

(1) They found that 3,600 was really 4,000mah and will market it that way as the packaging is different.

(2) They found an easy (cheap) way to increase the 3,600mah about 11% and will replace it.

I checked 409 Shop and they no longer offer the 3,600 that I could see and the RadioShop888 does not yet offer the 4,000. Clearly the specs on both are written with the same terminology so I would guess that the new unit is 4,000mah.

From: Jim
Topic: 7618 Message: 7619

CHIRP 0.2.3 is just a maintenance release for the 0.2.x series. We'll have to wait until 0.3.x for UV-5R support in a CHIRP stable release. Until then, we have to continue to use CHIRP daily version. My recommendation is CHIRP daily 20120730.

My guess is that the driver that you installed is higher than v3.2.0.0. CHIRP will work up to v3.3.2.102 but with the OEM software you have to use v3.2.0.0 or older.

Did that with the Baofeng rubber duck vs. the NA-701, driving, and got a few miles more with the 701.

I'll do similar with the J0125A when I get a chance. But right off the bat, the J0125A was noisy compared to the NA-701.

ah ok.
presumably the stock uv5R duck was noisy as well compared to the 701?
just trying to get a sence of the bench marks here.
sorry, I tend to forget not everywhere is flat like a pancake like where I live...I can talk into my favorite UHF box from my basement which is 3 quarters under ground using the stock duck and 4.5 watts...and the repeter tower is a good 20 plus kilometers away.
I can hit it with 50MW on other HT's from my back step...not bragging, but I sometimes forget other places don't have that kind of range over hilly terrain.

we had a good inversion about two weeks ago, and I was getting into VHF machines full quieting, over 100K away with the stock duck and low power setting on the UV5R.
anyway, it'll be interesting to compare with the 3.79 antenna.
maybe I'll splurge on a NA701 as well just to compare the 3.

No, there's really a UV-5R Plus listed. It fell through a time warp though, as it says it's new for 2013.
http://www.ebay.com/itm/2013-NEW-BaoFeng-UV-5R-Plus-Dual-Band-136-174-400-480-MHz-FM-Ham-Two-way-Radio-/170906753269?pt=2_Way_Radios_FRS&hash=item27cad618f5#ht_6238wt_1254

I don't know that it sounds any different though.

The UV5-r plus has been mentioned here before, a short time ago. IIRC
Somebody contacted Baofeng directly, and the factory confirmed it is
just a cosmetic change - they've fitted a metal panel on the top front
of the standard model. other than perhaps a different firmware revision,
the functionality and performance should be just the same.

regards,
Martyn M3MDY

From the pics it looks like maybe they went to an all metal case and the verbiage also suggest that. I would suspect that overheating on transmit is somewhat of a problem? Today my Red unit got overheated and would shut down during a long"er" QSO. I felt the antenna connection and it was plenty warm.

We have been going thru the renants of Issac the last 20 minutes or so, no problem this year here in New Hampshire.

interesting.
seems like the only changes, based on the description in buddy's link, are
two additional voice options, IE german and french, a metallic case which is
nice, and apparently 25FM radio frequency storage locations.
beyond that, there doesn't seem to be any differences.
But, perhaps some of the more well known bugs with the uv5R have been
fixed...
someone has to order one and let us know.

I bought one of these because it was $35 and others said that 220Mhz works. The one I received is indeed tri-band. The stock antenna is dual band but I can bump a local 224 repeater with it. Build quality is below that of a Baofeng. I'm going to buy a 220 antenna for it and play around on 220.

From past tests, yes. But the fact that the 701 was good audio, the J0125A had some noise and crackle, right there, it is not a match to the 701.

I live in a flat coastal region on the Gulf Coast (check my call sign on QRZ). No basements here! We only have one 440 repeater in this area, and I've never heard anyone on it.

> I can hit it with 50MW on other HT's from my back step...not bragging, but I

> Colin VA6BKX

Colin, we had also tested a NA-666 against the stock Baofeng antenna and the NA-701. This was not with instruments, but just driving down the road, talking through two repeaters in the area (about 20 miles apart). The 701 was the clear winner, the 666 pretty good, but not as good as the 701. The 701 gave another mile or two of clean audio over the 666 before it began to get noisy.

Both the 701 and 666 beat out the stock Baofeng antenna, but for being a short, stubby rubber duck, it performed better than I was expecting.

I don't presently have a NA-666, so can't compare against that anymore.

On another note, I have two UV-5Rs and a NA-701 for each. One NA-701 has the "blue label", that is, blue lettering printed directly on the black plastic base. The other is the "silver label", having silver lettering on a black blackground sticker.

I had read that both are legit Nagoya antennas, however, the silver label 701 is intermittent unless you screw it on very tightly. Using my "up close seeing" glasses and

plenty of light I cannot see why it is not making good contact with the pin in the radio. Also, this antenna has a slight gap on one of the two UV-5Rs, but not the other. I've contacted the seller for a replacement.

Both of the J0125As screw all the way down, and like the blue label 701, even unscrewed a few turns still make good contact.

I am not dissatisfied with the J1025A, and it is well worth $3.79, and a somewhat better antenna than the stock Baofeng. It is just not quite the equal of the NA-701, but perhaps close.

One of the repeater owners has a UV-5R, too, and bought a NA-701 based on his listening to me driving down the highway and trying the Baofeng, NA-666, and NA-701. I'll get with him in the next few days and do the same with the J0125A.

73,
Paul - AE5JU

Thanks for confirming 220 works. I'd be interested to hear how it works
with a 220 antenna. $35 ain't bad to have another band to play on.

Hi all, new to this group and this radio but not so new myself.

My UV-5R arrived a few days ago. While I really like this li'l guy and it works great, I noticed the drop-in charger light changing colors when empty, but connected to line power. Is this cause for concern or an additional "feature" from Asia?

Thanks in advance...Cal KK4DVA

Mine does the same, and the "feature" hasn't seemed to hurt anything so
far.

When you do things right, people won't be sure you've done anything at all.

Listening to USCG on VHF..strong station which breaks squelch...but then tx cuts out. Green light says it's still receiving and hitting monitor button gives good reception. Why is reception cutting out? Some kind of tone squelch? Thanks all

Solid Green with Pulsing Red (not to be confused with alternating Red/Green): Charger empty or charging error.

Solid Red: Charging

Solid Green: Charging cycle complete.

Somewhere between Charging and Charging cycle complete I get the following

Alternating Red/Green: ???

I've never figured out what that signifies.

What I ended up buying the TYY BCG-F8 charger base. It is either green (no battery or battery charged) or red (battery charging). It fits the UV-5R way better than the Baofeng charger. It works at 13.8 volts (the Baofeng charger base shuts itself down at around 13.2 volts) so with the proper cable I can charge batteries in the car (even with the engine running). And it was only $13.50.

I would think that if you had accidentally programmed a CTCSS or DCS tone/code, you wouldn't here anything at any time without the correct tone/code being transmitted by the station you are listening to. I suppose if they transmitted the correct tone at the beginning of the transmission and then it went away a little later it would behave like you describe. But I don't know why they would do that and you would have had to been lucky to pick the right CTCSS or DCS tone/code.

Just to be sure, when tuned to the USCG channel is there a CT or DCS to the left of the display when the PTT is not pressed (receiving)? If there is, then you do have receive tones programmed and that is probably your issue. If not, then more detective work will be needed.

Use the Chirp software. Very easy to us but I got lazy and really didn't check the receive coding.

7657. General Question about repeaters and programming

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-09 02:38:46 UTC
From: pba12300

I have been given the following but being new I need to confirm.

You can listen in on Repeater 448.825 (PL 100.0 Hz).

Does this mean to tune to that frequency and set the offset to 448.925?

Thanks

Bob

Just to "listen" to the repeater, all you need is 448.825. The offset and PL tone are for if you want to "transmit".

Hi Steve,

I would like one if it includes the 220 MHz band. The eBay sellers say it's VHF (136 to 174 MHz) and UHF only, they don't say anything about 220. Where did you buy one for $35? Do you have any idea how much power it's outputs on 220 and how sensitivity the receiver is? The UV3R I have will do the 220 band with modified software, but the output power only measures about 10 mW and the 20 dB receiver sensitivity is poor (about 1.0 uV) due to the front end not being tuned to 220, still it does work.

Thanks,
Steve

I have tried the old driver I downloaded from here along with the software I purchased from Radioshop888. I have uninstalled it several times and installed the old driver, disconnected from the internet, etc. I still get a "COM port error." I tried every COM port but none works, same error each time. My laptop has no LPT/COM ports listed in Device Manager; only USB Controllers because my computer has only USB ports and an HDMI port.

What do I do now? Thanks for any help.

I'm using an HP Pavilion dv7 with Windows 7 64-bit.

There's a Yahoo Group ofr this radio at http://groups.yahoo.com/group/UV8R/ and the radio is suppose to put out 6 watts on 220. I haven't measure it yet but it does hit a repeater about 10 miles from me.

I bought it from here http://www.ahappydeal.com/product-82752.html

Jim, I designed a charger some years ago (early 80's?) for R/C car batteries. This was back in the days when such chargers were just 15 minute timers with a resistor, running off 12 v car batteries to charge a 7.2 v (6 x 1.2 ah nicads).

I used an op amp as a voltage comparator, with a 7805 as a voltage reference, a resistor and large power transistor feeding current to the battery. As the voltage peaked to a certain value (appx 1.5 v charging voltage per cell) the op amp would cut off the power transistor. As the voltage of the nicad pack dropped from coming off charge, it would drop below a threshold and kick back on charge again. This cycle would repeat, longer off time, ever shorter charge times, until finally it would just blink on occasionally.

This is probably what is going on with this charger.

Depends on if it has a cloned chip in it or not. If it does, it won't gain you anything except a spare cable. If it has a genuine Prolific chip or FTDI chip then you just need to get a DB9 female to Kenwood style programming cable. To see what one looks like or to by one for less than $7 search on eBay with "6-004".

You'd be better off using a mobile radio for the transmitter,
and you'll have to cross-band to prevent desense of the
receive radio unless you have a cavity filter or quite a
bit of distance between them. The reason for the mobile
radio is that the long transmit times WILL burn up the HT.

and if it hasn't resolved that rather anoying problem, then it'll be allot harder to reem out the metal case compared to the plastic case.
I suspect dumping an after market electric condenser element into the radio and changing a few cap or resister values would make the audio allot louder.
Does the UV5R provide voltage on one of the speaker mike pins to run an outboard condenser mike?
Even a typical speaker mike has pretty low audio on these things. But if one can get voltage from the radio, or use some kind of speaker mike with a battery in it with a good loud mike element, or a properly amplified one, then it wouldn't be so bad.
I suppose that's part of what you pay $400 for in the yaecomwoods.

7675. radio, Battery or charger

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-09 07:49:10 UTC
From: Adam Holmes
Topic: 7675 Message: 7675

hi guys,

I have a baofeng uv5 and it worked great for the first day then went it came to charge i left it on all night ad in the morning no change - Still flat

No i have two of these units and it is starting to confuse me as to what the issue or part is (other unit is fine and has had many charge cycles it is used daily)

I have tried swapping charger bases and radios , batteries yet the fault seems to not be consistent. (could also be my brain losing it)

So my question is when using a multi meter if i measure the two outside pins i get a voltage of 8.27 to 8.45v
what is the middle pin for?
what else can i check i have cleaned the contacts on the battery but this has made no change
charger looks fine quick flicker on no battery - then red on placement but no change it just stays red after the night

Has any one ever returned anything to 409 shop ?? is it easy? i may just send the whole kit back if i can?

Thanks for your help
Adam

7676. RE: [baofeng_uv5r] Re: General Question about repeaters and programming

Topic: 7657 Message: 7676

No Bob,

448.925 MHz is only 100 KHz above 448.825 MHz (448.825 being the frequency you want to receive on)

When accessing a UHF repeater you need at least (depending what the service is, Amateur, Utility, Gov. Private business etc.) a 5 MHz difference between your transmit frequency and your receive frequency.

Then you have to know whether the offset is positive or negative (TX above RX or RX above TX)

Then you have to know whether you need to transmit a CTCSS, DTS or ANI tone by you to " open " the repeater and, whether you need your receiver set up to receive CTCSS or DTS as well to " ignore " other traffic..

I suspect the " PL = 100Hz " is the CTCSS tone required to access the repeater, you will need to find out what the split and the offset is to find out your TX frequency..

I hope that clears things up a bit for you.

Cheers,

Rob.

Actually, this is more of a design philosophy and a way of reducing
background noise.

it is supposed to be normal for purely chinese radios to want the unit
held close to the mouth. This reduces background noise, and,
theoretically, reduces the amount of noise that the user adds to the
background for others...

Mine also does the light show after the battery has been in a few hours and is presumably charged. For some reason I thought it should go green and stay green.

Not really, it's the standard for all LMR radios, which the Baofeng are,
even if they are marketed to hams.

All my Motorola radios need you to speak loudly into them. I expect the
Kenwood, ICOM and Vertex radios are the same way.

What most hams are used to are Japanese radios. In Japan it is illegal
for a driver to pick up a microphone and hold it to their mouth. So they
lay it in their lap, push the PTT button, and speak into it at a distance.

Non Japanese hams don't understand it and hold the microphone near their
mouth and speak into it. If they are not careful, their audio is
unintelligible. I remember being told to speak across the microphone
instead of into it when I was first licensed (1993) and had Japanese radios.

73,

Geoff.

Date: 2012-09-09 09:48:47 UTC
From: gteague
Topic: 7597 Message: 7681

just thought i'd report that i got my 3600mah battery in today and it was nearly 100% charged and fit perfectly (i'd read some previous posts about problems) onto the radio. it, of course, adds about 1-1/2" to the bottom of the radio, but it fits the hand perfectly and is very well balanced. reminds me of the old yaesu ftxx series of h/t's--tall and skinny. i still have some antennas and sma adapters yet to come.

on the same amazon order as the uv5r, i got a uniden bearcat bc-125a scanner since i always planned to deploy them as a pair. the new model uniden scanner has a very robust 'close call' module and it is very compact. thus i can detect freq/tone (it saves 10 hits to a temp memory bank) and, if needed, put the uv5r onto that frequency. about 10-12 years ago i had a very large portable frequency counter connected via a cable to an aor8200 scanner that did nearly exactly the same thing--for nearly $1000. my new system was about $150 and is easier to use and does much more. sometimes progress is nice, eh? [g]

i used this combo to pull all the frequencies from the security company at my workplace. nothing special: frs/gmrs/murs stuff. but it gobsmacked the security guard when i ran a radio check, so that was worth it! they do run the tone squelch, so i doubt he had heard anyone else on the channel.

i'm still struggling with some anomalies involving moving vfo freqs and memories around and trying to learn chirp. hopefully some tips lynn so kindly gave me will allow me to run chirp on my mac and i plan to make that my priority when i get off work early this coming week.

at any rate, i know i'm preaching to the choir, but this is absolute best $50~ radio i've ever owned. my $500 yaesu is out of commision and this cheapie nearly makes up for its absence.

i still need to post my serial# and firmware version, but i think the radio i got is one of the newest ones judging by what i've seen so far. at least it dodges some of the bugs i've read about on here with the older models.

Adam,

The middle pin isn't used for anything. Isn't even connected to anything inside the charger base.

What is the voltage coming out of power supply that plugs into the base? Some units were shipped with 8.4 volt power supplies. The power supply needs to supply 12 volts (or at least 10 volts according to the laughable sticker on the base).

Here's what I would do, but do it at your own risk...

With the power supply disconnected from the charger base, remove the 4 screws and take off the bottom of the charger base. Check to make sure the soldering looks OK. Some have reported that the battery contacts were poorly soldered to the circuit board. Mine were soldered OK but there were solder globs inside that I cleaned out so they couldn't come loose in the future and short something out. If yours is poorly soldered and you are handy with a soldering iron, go ahead and make repairs. If the soldering is OK, lets move on.

With the bottom cover still off, plug in the power supply and then plug in a battery (without the UV-5R) into the charger base with the bottom of the charger base facing up (I propped mine up with books or something). Now measure the voltage at the two outside pins. It should still be > 8 volts. If it drops down into the 7 volt range, I would say the charger base is defective. Remove the battery and power supply from the charger base and then reassemble the charger base.

I've bought several things from 409shop. I've not had to return anything (knocking on wood). But from what I read here, they will work with you). I think they only have you send back the defective item.

I wanted a second charger base so I could also have one setup at work. I decided to get the TYT BCG-F8 because someone else had purchased and claimed worked (search the group with "BCG-F8" and I'm sure you will find a comparison). The fit of the UV-5R and/or battery is so much nicer in the TYT charger base. It's the charger base that Baofeng should be selling with the UV-5R. They are only $13.50 from 409shop shipped.

Hope this helps.

To avoid opening the Rx radio, you could use a photo transistor to detect the Rx LED and provide PTT for the Tx.

If Device Mgr does not show Com Ports, you are missing a driver. USB cables show as Com Ports when the correct driver is installed. Read the driver information in this Group carefully.

For those wanting to try what Geof suggests, there is an eBay auction for "USB to RS232 Module Board CP2102 Breakout" which is very similar to what is shown for only $5.55. One could probably solder the three wires directly to the correct pins or even remove the pins and the wires directly to the circuit board. I think I might order one and try to come up with the push-on connectors.

Item number: 130473345331

If you enter cp2102 you find 160 or so of them, starting at about half
of that price.

Geoff.

Topic: 7672 Message: 7690

Hi,

this is an interesting wiring diagram and a way to make a simple repeater.

I was just finishing testing and getting ready to write about a very small inexpensive repeater setup.

My repeater uses two Baofeng BF-888 UHF radios and a small computer to do the announcing. And maybe more by dumb luck both the Baofeng BF-888 and the UV5R radios put out about 2 V DC on the speaker out circuit which I was able to use to tell the computer that the repeater was receiving a signal. I was also able to key up to transmit radio using a single transistor.

It may not be the most robust repeater system but I figure including the two radios and then get client computer that I only have about $75 in the whole setup and for a light-duty emergency repeater it could be quite useful.

I still need to finish testing (the computer and the antennas) and redraw my semantics and then I was actually hoping to post the information here on the group.

Silas

Subject: [baofeng_uv5r] UV5R repeater signal wiring

Hi,

I want to build repeater using UV5R.
I need signal wiring like this one:
http://bartk.us/t/tiki-download_file.php?fileId=101
<http://bartk.us/t/tiki-download_file.php?fileId=101&display> &display

thanks

You might take a look at this to use instead of a computer for IDing:

use a blunt screwdriver or similar to gently pull the rubber back in place, i did this when i first took my radio apart, its hard to reassemble the radio without trapping the rubber ptt in the wrong place, be careful, too much and it can rip.

Yeah, I had to take mine apart, and that befuddled me when it came time to put it back together. Don't worry--the solution is simple.
Find a piece of plastic like an overhead transparency or similar. ("Rage wrap" is probably too thick but would work in a pinch.) Slip it between the buttons and the radio body as you insert it, and then pull the plastic out afterwards. Problem solved. Too simple, huh?

7695. BCLO will not stay on

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-09 19:38:04 UTC
From: James
Topic: 7695 Message: 7695

I am using Chirp. I check the BCLO on the community repeater freq. Then go into the radio and set the BCLO on. It will not say on as soon as you exit, it goes back to off, although the voice indicates the command has been entered. Any thoughts?

Jim

Yes, After it is checked in the software and downloaded into the radio, it will transmit on a busy channel, (i.e. it goes into TX and no tone or anything is heard to indicate the channel is busy) When you check it in the radio it is off. As soon as you turn it on and escape and go back into the radio menu, it is OFF again.

Hi all,

I just got a UV-5R and really love it! My question concerns the awful software that Baofeng supplies. Is there no way to copy and paste entries from another file? I had to type each two meter frequency in by hand including the input and output freqs. Why not have it where it would auto the offset for the input when typinn in the output freqs? I have tried the Chirp software and have not had any luck with it at all. Running Win 7 64 bit Ultimate here and tried the 64 bit version but it simply will not run. Does the CHIRP software allow copy and paste?

Thanks and 73s

Steve W4YJ

Steve,
I use CHRIP on W7U SP1 64bit no issues
it is a little pain ful with copy and paste yes, the option to export to csv is what i ended up doing and it works very well.

Do you get any errors on CHIRP? tried compatibility mode ?

Thanks
Adam

Topic: 7710 Message: 7710

I'm sure this was probably discussed before, but I'm at work and can't access any yahoo groups directly, so I can not search for it. Please bare with me.

Question A - Does the UV5R have a tone scanning function ?

Question B - If yes, how does it work ?

I had a Kenwood that had a tone-scan function . Unfortunately it was stollen from my car :(

there is a vendor selling one that is listed as 400-520 and the specs say the same. i know you can set the existing radios to that range in chirp, but i wonder if this model (assuming the seller has it listed correctly) is more optimized for that wider freq range.

From: greger_g
Topic: 7715 Message: 7715

The first UV-5R I bought was version 281, the second I bought was from another company and they sent me 251 version where the eng. voice had a very strong chinese accent.
So I ordered a third one from the first company hoping I'd get another 281 but they sent me a 251 version instead - HOWEVER this one has the same clear english voice as the 281 one...

Obviously the voice comes independent of the firmware version,
or is this dependant on the version number you get when pressing '6' during power on?
The first 281 and this latest 251 both say "120722A ver-05" (don't remember what the second unit said)...

Treading on eggshells now. Don't want this to fry like the last one. Before the Prolific information came to light, I tried that many things to get the last cable to work, I can't remember what was installed on which computer.

Presumably, if I just plug it in and that computer has Prolific drivers that have already been updated, this new cable will fail like the last one. Without plugging this new on in, is it possible to tell what drivers have been installed?

I need a step by step guide to get this one working.
Thanks.

lynn provided post #2106 from back in may when someone got chirp working on the mac. i followed the links in the post and to about six other sites gathering files and information and finally thought i was successful when i issued a 'kextstat <drivername>' voa the terminal and saw the kext file was loaded in the kernel. also, securecrt is able to see and connect to the serial device created by the pl2303 driver, but i didn't have the first idea what commands to try to issue to the radio or if i should have been able to see it or talk to it at all. if anyone knows if i can query the radio using a serial communications program such as zterm or securecrt i could prove connectivity down the serial port and that would mean the problem lies with chirp.

but unfortunately every build of chirp i've tried reports that the radio is not responding. the radio is 'seeing' the query from chirp because the display lights up. the radio and cable worked fine using chirp on windows7 in vmware emulation, so i know the radio and cable are fine. i just wonder if the firmware updates on the radio (mine is 251 i think) has gotten out of sync with what was working before. i installed the daily builds for random months all the way back to the date of the post with no success.

can anyone who has chirp working on the mac report back here so i can ask some questions about how they did it? i'm getting the bad feeling that this only works with the usb-to-rs232 cable and not the usb cable which i'm using. i do have one of the old rs232 adaptors, but it would be a real kludge to try to cobble adapters together to get the radio to use it.

any help greatly appreciated -- save me from having to use windows -- no one deserves that fate -- i spend enough time on it at work to have to suffer at home as well! [g]

i had a thought and went over to my windows image in vmware and copied the chirp .img file to the mac. i then opened chirp on mac and loaded in the file and then tried to upload it to the radio. at first it acted like it might be doing something, but after a minute or two it was obvious it wasn't doing anything. no error message at all--very strange.

i still suspect that this mac setup might be for the rs232 cable. hope someone can respond that they are using the mac with the standard wouxun usb cable to give me the incentive for some more hours of troubleshooting to get it working. chirp looks considerably better on the mac, but maybe that's just my jaundiced eye ... Hello,

I use OS 10.7.4 and the USB cable from Wouxom US with Chirp. I downloaded this:

http://changux.co/osx-installer-to-pl2303-serial-usb-on-osx-lio

to configure the cable.

I downloaded a daily build of Chirp and everything works fine on two different radios and three different laptops.

Hope this helps

Tom

thanks for the confirmation that it does work tom. after i read this i continued trying to download from the radio and at (nearly literally) the 40th or 50th attempt it did so. but the next half-dozen attempts to repeat this failed. i then changed some settings and attempted to upload and it failed at least 10-12 times and then, seemingly at random, it took the upload. it is just flaky as hell. i've tried different usb ports (but you know i am running through a hub, so the next trial i'll try using one of the in-built ports instead of the hub and see if that works better. i would suspect a flaky cable except that it works 100% with windows (and remember my 'windows' is running on the mac and thus i was using the exact hub usb port i'm using on the mac. and yes, i did go into vmware and tell it to release the usb device for windows and let the mac use it.

so i have some more troubleshooting to do before i can trust it. but i guess if i get in a bind i can always return to windows and the chirp .img files will copy back and forth so at least i won't get stuck with an old file on windows that i can't convert on mac. i'll just have to be real careful to save a new file for each change i make.

again, tks for responding that it's working for you. that gives me hope i can work out the rough spots on my system. and i am getting another cable in later in the week just in case i do have a cable the mac chirp doesn't like. and yes, i am using that driver. it's funny, i got an emf meter about a month ago which has a pc logging function and although i never got around to trying to get it to talk to windows (there's no mac version of the logging software), that was the exact same driver that meter needs. so now i may be able to hook my meter up as well!

With hubs and such, your devices may load in a different order. I
recall that this is an issue with Linux, but haven't had many devices
connected through hubs to my Mac to encounter this kind of problem.

I do recall that my cable (from Amazon) reads as a 2033/X in the
syslog, searched for that, installed one driver than another, and
finally got it working. This other TrendNet rs-232 serial cable I have
also started working with the new driver. I believe that many serial
cables are totally unsupported by the built-in drivers that come with
OSX and Windows.

The UV-5R programming cable I have will show up as one of two named
devices, I'm not sure what determines this yet, and it may depend on the
USB socket that I plug it into. I can only imagine the sheer horror of
having to debug this with Windows, and I really feel for y'all pulling
your hair out with that.

I do strongly suggest Linux - put it on an old junk computer, and give
it a whirl. Once you get it up and running, using things like wacky
usb/serial devices becomes much easier to figure out. RedHat's Fedora or
Ubuntu might be a good place to start.

My USB cable works on OS X--so that's not the problem

If 'kextstat <drivername>' worked, it was successfully installed.

The next step is to make sure that VMWare is not capturing the port--especially since you seem to have used the cable with VMWare in the past. But you report the radio is seeing the query from CHIRP--so it seems like OS X is seeing the radio.

Mine worked at that point so I don't know what else to suggest. I'm now on 10.8 but I've had it installed since the earlier version.

Are you getting the error on both upload and download? Which version of CHIRP?

I have chirp working on OSX but I'm using 10.7.4

A problem I do have is I will occasionally get a kernel panic when I go to load the radio. I am pretty sure, but not 100%, that this occurs when I am in VFO and not Channel mode. It could also be totally random, but make sure the radio is in channel mode and try it.

Good luck!

Your charger is doing what mine did. Check the contacts, I think you will find that when you insert your radio, one of the contacts is bending down around the radio bottom instead of sliding along the battery contact.

To fix:
1. Replace the charger with another just as bad one.
2. Replace the contact with real brass with a smooth curve that doesn't catch.

I have tried every driver at least five times, walked through
the instructions at least 10 times and got it to connect
twice before it crashes and I start all over again...

I have the radio programmed with CHIRP - which works well and
kudos - I would be a wee bit closer to insanity if it didn't...

I am running vista 64bit and tried it on a windows 7 and I
got the rig to worked once each time, then it crashes...

The comm problem is frustrating to say the least and it has
really influenced how I view this radio - cheap yes - but really?
I like the size, weight, features and price!
Not sure if the USB cable was really worth it after all - its
a shame as this little portable is nice.

I am thinking that this wasn't really a bargain after all...
more of a loss leader to buy a better rig... any how - I want
to thanks to all the folks out there tweaking this portable/software
keep it coming - maybe we can get it working...

I feel for you man. I just hate it when something that should work, doesn't. It sounds like you've been through a lot with this little radio and still don't have a satisfactory resolution.
You're probably alert to this already, but it sounds like your problem might be with the computer and/or Windows rather than the radio/software/cable/driver. Oodles of us (that's a technical term) have had issues getting this stuff to work, but outright crashes don't seem to be a common part of the profile.
Have you tried a different computer, just for comparison? For example, if you're working on a Dell Latitude laptop, I've heard there is a bug in the firmware for the USB ports. Maybe the problem lies upstream with the COM port driver itself. Can you re-install that?
My only other piece of input would be "take a break". I don't mean that sarcastically--when I'm frustrated by something not working I know I need to punt, walk away for a time, and come back to it "whenever" with a fresh set of downs.
We'll get it sorted out somehow.Ian

> drop between user transmissions.

To which I would like to add:

You might even consider setting it to the next step down, which is 165.
This would prevent you from actually hitting the three-minute mark and
causing a delay in your communication while waiting for the repeater to
reset itself from being timed out.

If your portable radio stops transmitting, you simply let go, pause, then
continue speaking. If the repeater cuts you off, various algorithms could
take several extra seconds to reset.

It's a very minor issue; 180 could be just fine; it's your choice.

Hi,

Not sure if this is relevant to your problem or not However,
I use two accounts on my Machine(x86 Core2Duo Win7 Ult) one admin one user when i installed the software i needed to use the admin account once i switched to the user account the one i use everyday for most things the software would refuse to read or write to the radio no matter what i tried in some instances it could tell me the radio was present but that was all and included some hang ups(off to task manager etc). run the software with the admin permissions and all was good. apart from this my experience was the opposite of yours. I am sure this group will solve the problem given enough info and a small amount of time hope this helps

Lyndsay

Meggy,
Once you have the correct driver installed and working, you can swap between cables without an issue. My advice is to always use the same USB port.

7743. Baofeng UV-5RE - A First Look

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-10 22:28:11 UTC
From: apollomaker
Topic: 7743 Message: 7743

Well after a long wait, finally received the pair of "RE" radios from HK.

As expected there are some differences but they are minor.

1. The case has been redesigned overall, even though at a quick glance they look similar. The edges are different and the bright front bezel plate has been added.

2. The keyboard has been changed to a different type with flat keys and a little different tactile feedback to them. The CALL and MON buttons are a different shape.

3. The firmware version in my radios is BFB281. There are no blatant differences for the user, but maybe some tweaks under the hood not yet discovered here. The English voice is American like the BFB251 firmware.

4. The large battery (3400 mAHr) does not fit due to the changes in the case design. The good news is that the fit obstacles are easy to cut away on the large battery mating surface (inside out of view) and you can use the large battery once you do a little "plastic surgery" with a Dremel tool. It was easy. No problem with the big battery still fitting fine on the earlier case design.

5. The small stock battery (1800 mAHr) that comes with the "RE" radios is interchangable with the earlier radio design -- no issues there.

I have only had the radios for a few hours on the bench so have not had any time to tinker further but at first look, they are virtually the same radio, with the visible and probably some invisible tweaks for the better. If anything, the "RE" radio is a bit more robust overall.

i'm using the latest daily chirp build (chirp-daily-20120906), i've installed the python runtime (i don't think chirp would even start up without it -- KKDS_Python_Runtime_R107.pkg) and the driver is PL2303_Serial-USB_on_OSX_Lion.pkg which i got from this page (http://changux.co/osx-installer-to-pl2303-serial-usb-on-osx-lio) where i got the terminal diagnostic commands.

the symptoms are those i would attribute to a loose connection or flaky radio or cable if i didn't know they work perfectly with windows, so that only leaves the mac driver or some conflict with my mac os software since i plug into the same hub when i use windows.

maybe it's something about the way the mac deals with the usb bus through my particular usb hub, but i guess it's just some way the mac driver communicates differently than the windows driver even if, as in my case, they are using the exact same hardware and usb bus. i'm actually getting a wouxun radio in a few days with a cable (which i think is the same cable for both radios) and then i'll be able to compare to form an opinion as to whether it's a driver or a hardware problem. at least it's working pretty reliably with windows so worst case i can use the mac chirp app to set up my channels and then use windows with the mac file only to transfer them. that way i only have the minimum amount of interaction with windows and i can set up my radio config and channel scheme on the comfort of my mac.

again, i really appreciate the troubleshooting help and i'll be sure to post back when/if i figure out what the problem is.

oh, and isn't the normal behavior of the radio to light up the little ?xmit? light below the vfo/channel button only when data is being passed? the lighting on my particular radio seems sort of random at times. it will light up the display blue when i'm just sitting on a single squelched channel and nothing breaks the squelch. likewise, when i'm trying to get the radio to communicate with the mac, sometimes this red light will light up when i'm not actively trying to connect to the radio. but, if i remember rightly, when i'm using it on windows that light only activates when i'm uploading or downloading.

i'll know much more about where to point fingers when the other radio (wouxun kg-uv6d) and cable arrives in a few days.

> >
> > but unfortunately every build of chirp i've tried reports that the radio is not responding. the radio is 'seeing' the query from chirp because the display lights up. the

radio and cable worked fine using chirp on windows7 in vmware emulation, so i know the radio and cable are fine. i just wonder if the firmware updates on the radio (mine is 251 i think) has gotten out of sync with what was working before. i installed the daily builds for random months all the way back to the date of the post with no success.
> >
> > can anyone who has chirp working on the mac report back here so i can ask some questions about how they did it? i'm getting the bad feeling that this only works with the usb-to-rs232 cable and not the usb cable which i'm using. i do have one of the old rs232 adaptors, but it would be a real kludge to try to cobble adapters together to get the radio to use it.

hi bob:

quick question. is the uhf freq range under the battery still 400-480 or 400-512 or 420-520 or something different. because i've been seeing a couple of uv5r models on ebay as advertised with the wider range.

tks, /guy (73 de kg5vt)

Asunto: [baofeng_uv5r] My first VHF contest with the UV5R

It was on late Saturday, last Sept 8th. I asked my young son to drive the family car , a few blocks from home, atop of an elevation 72 meter high (over sea level).

Not too much stations, active in Montevideo, Uruguay in 2M VHF as in years ago... but anyways it was a very enjoyable hour. 10 stations, a 60 points claimed score. Many contesters had 7el. yagis and rotors and watts. It was not for the sake of winning it, just for fun. And it was fun. Learning and thrill. My first 2M contest. A nice celebration for a 39 year anniversary, involved with the radio hobby. Many years as a SWL/BCL... only a few as a ham... but always involved with them in many ways.

Hi Jim ----

Well, the only thing different inside is the addition of the below alpha group added to the black sticker at the center bottom:

"CMITT ID:2012FP1942"

Do you recognize this ???

Hello Guy ----

Interesting question. First, the sticker inside still shows a maximum of 480 MHz. I found though that using CHIRP, I was able to get reliable control up toward 500 MHz. Based on the tests I did, I would not recommend any use (to keep it reliable) above about 490-495 MHz. There have been times when some units have been stable up toward 505-508 MHz but it seems to program sometimes, then other times it refuses to work that high. I am not sure if it is a programming issue or just a limit in the radios.

Hope that helps --- Bob K6WL

after all the talk of the $3.xx ebay antennas, i saw this on amazon and had to order one just out of curiosity even though it cost me an additional $3.99 for shipping:

http://www.amazon.com/dp/B008Y2SPH6/ref=pe_175190_21431760_M3C_SC_3p_dp_1

but i think the one i'll be using most for virtue of compactness is a retech rha601 which just came in and i'll be trying out later tonight. anyone using this particular model?

i set mine in chirp for 134-176 and 400-520 and just about an hour ago got around to testing if it worked anywhere around those limits. i couldn't detect any xmit below 136 or above 512. and then i realized--i'm using a uniden bc125a scanner on close call and it's range limits are 136 on the low end of vhf and 512 on the upper end of uhf. so the radio at least does put out enough power at 136, 176, 400, and 512 to trigger close call frequency readout and audio at a few inches. power may be measure in microwatts, but at least it operates at those extended freqs. unsure whether it will receive though as i don't yet have an xmit source to test rcv.

Yes. OK, now I am getting in sync here. It does have the FCC logo on it. So do my older vintage versions too.

Hi Again Guy ---
You really need a good frequeny counter to tell if the synthesizer in the radio is locking up reliably to the programmed frequency. It must be stable and exact otherwise it is not usable.

Bob

--- In baofeng_uv5r@yahoogroups.com, "gteague" <accts@...> wrote:
>
> i set mine in chirp for 134-176 and 400-520 and just about an hour ago got around to testing if it worked anywhere around those limits. i couldn't detect any xmit below 136 or above 512. and then i realized--i'm using a uniden bc125a scanner on close call and it's range limits are 136 on the low end of vhf and 512 on the upper end of uhf. so the radio at least does put out enough power at 136, 176, 400, and 512 to trigger close call frequency readout and audio at a few inches. power may be measure in microwatts, but at least it operates at those extended freqs. unsure whether it will receive though as i don't yet have an xmit source to test rcv.

Based on the tests I did, I would not recommend any use (to keep it reliable) above about 490-495 MHz. There have been times when some units have been stable up toward 505-508 MHz but it seems to program sometimes, then other times it refuses to work that high. I am not sure if it is a programming issue or just a limit in the radios.

I have a UV-5R and cable purchased from the Woxun website. I down loaded the Chirp and I do not understand how to enter frequencies with the computer to the radio. Can someone please explain to me simply how to do this? I got a screen on the chirp program that looks like it is the correct screen, but when I try upload a frequency it does not appear on the radio readout. Also, when i push scan in the channel mode the radio only scans 000 and 127, back and forth. Help!

Hi Steve,

I may be wrong but did you download from the radio to your computer first?
It's what I did. I believe that Creates the .img file needed that your
radio recognizes.

Steve,
When you do a Menu 40 RESET | ALL all menus are set to the factory default, all channels are wiped and default channels 0 and 127 are programmed. So SCAN is scanning the 2 channels as it should.

7772. Re: chirp not working in mac osx lion (10.7.4)

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-11 05:00:36 UTC
From: gteague
Topic: 7718 Message: 7772

i've had a couple hours to play around with chirp in windows emulation and mac this evening. i first opened up chirp in windows and downloaded from the radio with everything exactly the same as when i was having problems with the mac version earlier. no hitch. i edited in chirp and uploaded and downloaded at least a dozen times without a single glitch.

i then suspended the windows vm and quit the vmware app. i didn't disconnect anything and also i did not use the windows system tray tool to 'eject' the usb device. i then brought up the mac version of chirp and it would not recognize the radio. so there's a serious conflict, at least on my particular mac, with chirp or the driver. the good news is that there's absolutely no reason to suspect or have to troubleshoot the radio or the cable.

i still need to fire up the windows vm and try 'ejecting' the usb port and/or telling vmware to let the usb device connect to the mac instead of the windows vm. i can also try shutting down the windows vm instead of just suspending it in case it's got a 'hold' on that usb device. i'll report back after i've done that.

and i did notice that the mac version of chirp is missing some components of the windows version--specifically those canned channels/freqs such as marine and murs. matter of fact, when i tried to access radio ref database from the mac version it told me i was going to have to install more python modules in order to connect. given all this, i'm about to conclude that using the mac version of chirp, at least in my situation, is not very worthwhile. the good news is that the uv5r only has 127 channels and once i've programmed in my preference i'll only have about 10 dynamic/scratch channels left to play around with on a daily basis and those can be programmed by hand.

and does anyone know how you can batch edit the line items in chirp? in other words, it takes 4 perfectly timed clicks for me to change the default data in the /power/ field from high to low and it's tedious when you have to do this 127 times. if batch editing is possible, i wasn't able to discover the trick. and some radios have hundreds, if not thousands of channels--i can't believe that the chirp programmers haven't allowed for this--i'm most likely just missing it somehow.

i ordered 3 adaptors from an ebay seller trying make sure i got the right one and i missed it all 3 times.

i'd like to use my sma antennas that mount on the yaesu vx7r on my uv5r. i guess the one i got was an sma female to sma female and as far as i could tell, it didn't adapt anything--just lets me mount another uv5r antenna onto the adaptor, which i'll bet we can all agree is useless! but perhaps you could patch together two coax pieces with it, if you were so inclined.

anyway, is this the adaptor i need to mount sma yaesu-type antennas on my uv5r?

http://bulky.bitly.com/504ec968dc87ac0b4f42ef68504ec968dd6a49ed290004fc/UE7JaKgvKY64_o34Ae234

if not, could someone post a link?

I borked up. You need an SMA female to SMA female
http://www.universal-radio.com/catalog/parts/4304lrg.jpg
I can screw my Baofeng antenna to my Radio Shack antenna.
With the double female, I can use my better antennas on the 5R.

Subject: [baofeng_uv5r] i got the wrong adaptor

i ordered 3 adaptors from an ebay seller trying make sure i got the right one and i missed it all 3 times.

i'd like to use my sma antennas that mount on the yaesu vx7r on my uv5r. i guess the one i got was an sma female to sma female and as far as i could tell, it didn't adapt anything--just lets me mount another uv5r antenna onto the adaptor, which i'll bet we can all agree is useless! but perhaps you could patch together two coax pieces with it, if you were so inclined.

anyway, is this the adaptor i need to mount sma yaesu-type antennas on my uv5r?

http://bulky.bitly.com/504ec968dc87ac0b4f42ef68504ec968dd6a49ed290004fc/UE7JaKgvKY64_o34Ae234

if not, could someone post a link?

tks for the reply, but i'm pretty sure the yaesu vx-7r uses an sma male connector. it looks like the last 3/8" of a bolt and is threaded. mine is not working, but i just went and looked at it and it is definitely not a bnc. the antenna has a cavity about 3/8" wide that screws onto the 'bolt' of the radio. i think it is the male aspect of the sma female that the uv5r uses.

but i can't tell from the pictures i'm seeing at various sites and sellers if their adaptor is what i need and some sellers use the male/female description wrongly. that's what bit me with the first 3 i tried.

btw, i did manage to get the adaptors to use bnc antennas (either male or female) on the uv5r since my uniden scanners use bnc antennas and about 60% of the antennas i've collected over the years are bnc and the remainder are the ones the yaesu uses which i'm calling sma male until i find out different.

the problem with the adaptors is that they pretty well ruin the lines and maybe hurt the swr, although you can't hurt the swr of any duckies very easily. and they make it more possible that some pressure on the antenna might bend your radio connection.

Your Yaesu VX-7R uses an SMA-Male antenna.

You need this adapter to use your Yaesu antennas with your UV-5R:

http://www.ebay.com/itm/370481762422

If you want to use a BNC antenna, you will need this adapter:

http://www.ebay.com/itm/220986845024

Your link is for a SMA female to type N connector. I assume you need a SMA female to SMA female - that's what's required to mate the UV-5R with the antenna from my Yaesu VX-3R.

Here's an example
http://www.ebay.com/itm/2pcs-lot-RF-Connector-Adapter-SMA-female-SMA-female-/280881322051?pt=US_Radio_Comm_Coaxial_Cables_Connectors&hash=item4165d4d843

Lots of other SMA fittings available from ebay seller allinstore2010 but I haven't received my recent order from him yet, so this is not a recommendation.

Topic: 7791 Message: 7791

Any implication to UV-5R?

But UV-5R can transmit in narrowband, right?

---
http://ra-comm.com/narrowbanding/index.htm

As of January 1, 2013, the Commission's rules will prohibit Industrial/Business and Public Safety Radio Pool licensees in the 150-174 MHz and 421-512 MHz bands from operating with wideband channels (unless their equipment meets the narrowband efficiency standard), even if the license still lists a wideband emission designator. Licensees operating in wideband mode after January 1, 2013 that have not received a waiver from the Commission extending the deadline will be in violation of these rules.

Operation in violation of the Commission's rules may subject licensees to appropriate enforcement action, including admonishments, license revocation, and/or monetary forfeitures of up to $16,000 for each such violation or each day of a continuing violation and up to $112,500 for any single act or failure to act.

The UV-5R does narrowband. This will not affect the ham frequencies, so those you should leave set to wide band.

Not an issue in UK, we already use narrow on most 2 metre frequencies, and some, (not all) repeaters here don't tolerate wide deviation well. (audio comes out poor)
Glad I don't have to deal with the FCC, our regulations are a bit more relaxed as far as I can tell from many ham user groups i'm in.

i still think you need a male to female or vice versa. the uv5r has a sma male connector which uses a sma female antenna. the yaesu has a sma female on the radio which uses a sma male antenna. thus i would think you would need a female (for the male antenna) to male adaptor.

here is one of my yaesu antennas although i'm having a hard time finding an image of the actual connector:

https://www.gigaparts.com/store.php?action=profile&sku=ZML-MH-511
http://www.universal-radio.com/catalog/hamantht/1076.html
http://forums.radioreference.com/attachments/old-classifieds-archives/5106d1159420282-sale-yaesu-vx-7r-w-lots-extras-vx7r3.jpg

this link from texas towers specifically says 'sma male' in the specs:
http://www.texastowers.com/mh511.htm

evidently the baofeng uv-3r has an sma female connector like the yaesu and i think the wouxun kg-uv5d has gone to the female connector after the early models had a male like the uv-5r.

ok, i think i've found one folks:

http://www.pacificcable.com/More_Pages/SMA-Adapters/SMA-Male-To-SMA-Female-Adapter.html

even better, some close up images of both ends. warning, will need to have a java plugin for something on the page, but it shows you the adapter ends without that plugin which i disallowed:

http://www.pacificcable.com/Picture_Page.asp?DataName=SMA-2510

these guys are on the ball, there's even a pinout diagram of some sort. i think i'll be trying this one out.

...

but wait a minute. according to this page ...

http://www.data-alliance.net/servlet/-strse-83/Adapter-SMA-dsh-male-RP-dsh-SMA-dsh-female-RP-dsh-SMA(M)/Detail

... you have to take polarity into account. evidently this means that the pins and jacks have to match up. for example, the pin on the uv5r is on the radio and the jack is on the antenna.

from the very good pictures on this page, it looks to me like there is a pin in each end of this adapter (a line below confirms it) which wouldn't work since the uv5r has a pin in the mount. so now we have polarity and reverse-polarity to throw into the mix, viz:

http://support.data-alliance.net/rp-sma-connectors/

i highly recommend this page for information on sma connectors, but, unfortunately it looks like even they don't have what is needed which i now think is a male-to-female normal (not reverse) polarity on both ends. in other words, there cannot be a pin in either end because the yaesu-type antennas have a pin and the uv5r radio has a pin, thus each end of any adapter would have to have jacks and not pins.

so this one is the closest i've come so far, but unfortunately it only shows a picture of one end (arrrrrrrrgh!), but it does say 'reverse polarity' for one end which i interpret to mean it has a pin and not a jack on the unseen end.

i'm left to conclude there is not a readily available adapter for the specific combination of uv5r and sma antennas. i'd love to be proved wrong.

well, after a couple hours of poring over adapter web pages, i'm going to take a chance on this one:

http://www.data-alliance.net/servlet/-strse-591/Adapter-cln--RP-dsh-SMA-dsh-male-to-SMA-dsh-female/Detail

according to this info page from that site:

http://support.data-alliance.net/antenna-cable-connectors/

RP-SMA-female has threads on the outside and a pin (rather than a socket)
RP-SMA-male connector has threads on inside & a socket (rather than a pin)
SMA-female connector has the threads on the outside and has a socket

so, trusting their info, i can only conclude that you need a rp-sma male to female sma which i hope is what i ordered from the previous page.

wow! if any of you guys has actually gotten those yaesu type antennas to work on the uv5r without going through all this nonsense, consider yourself lucky. i'll report back when the adapter comes in to let you know whether i lucked out or bombed again. my head hurts.

We still use wide up here in West Cumbria. One repeater sends a morse "W" after an over to tell me I'm wide but I've never had a complaint about my audio. Some people have audio I can barely hear - I assume they are the ones using narrow deviation.

7800. $3.79 J0125 Antenna TESTED on Anritsu S331E

Topic: 7800 Message: 7800

I ordered two, which took about two weeks to NY.

Antenna 1: Resonant at 140 MHz and 388 MHz

Antenna 2: Resonant at 146 MHz and 401 MHz.

Baofeng stock antenna poor at VHF, but better at UHF than J0125

My two J0125 antennas were not tuned the same. The resonant antenna at 2 meters was clearly performing better on the radio than the stock antenna. UHF was no improvement.

The instrument confirmed the results.

All of these antennas are not good. on UHF, but one might get lucky on VHF.

It seems there are a multitude of different marketing deals to be had on ebay (and elsewhere, I have no doubt), for each of the different varieties of UV-5R (I've seen UV-5R, UV-5R II, UV-5R Mk 2, UV-5R Plus, UV-5R+Plus, UV-5RE, ... (but all basically the same radio).

Some come with 3600mAh (or now, even 4000mAh) batteries, most with the standard 1800mAh offering. Some include fist mics, some have programming cables, some have both.

There are also multi-packs 2, 3, 7, 10 (etc) HTs, and batteries of all capacities ...

... and then you have the range of colours (including camouflage!) ...

... and that doesn't include the different brands that use the same radio chassis - some with, some without the flashlight...

In short, look around for longh enough, and chances are, you will find all possible variations on the UV-5R theme. :)

regards, Martyn M3MDY

Hmm. I ordered two, just to have a spare. Looks like I need to ask around for some equipment to borrow.

But, I suppose I'm not terribly surprised. At that price shipped they have to be almost giving them away (although I really have no clue since I don't know how things work in China) some QC issues are expected.

Thanks for running the tests. Maybe I'll have to just run a simplex test with someone and see which one reaches further.

They also are not as universal as one would think. They are built for
Chinese radios which have a much longer and slightly wider center pin.

If you look inside the antenna, you will see that the connection for the
pin is recessed.

When I tried to use them on a Motorola Visar, which also has an SMA
connector, the pin in the radio is shorter and smaller and does not make
contact.

The Motorola antenna has its connection flush with the outer part.

I assume you could use it on a radio with a bigger pin, but it might not
work with the original radio anymore.

Geoff.

That sounds right Julian, obviously wide fm sounds better, and I know one or two people using icom d star radios can have "weak" audio since they are often narrow to 2khz deviation when in fm mode , on the other hand, i have an old alinco that only has wide as its fm deviation, and apparently sounds poor through my local repeater gb3in which doesn't tolerate the wide setting well. I can work through this repeater, but am forced to having to get inside the radio and adjust the deviation with a borrowed racal dana 9009 meter. I have no menu option to go from wide to narrow on the old alinco, (dj g5) but this old radio has crossband and talk through ability so its worth the work I have to do on it.
BTW, there are at least 4 repeaters near me so perhaps its good they require narrow, we are running out of bandwidth.

The primary change in the FCC's rules (USA only) as of January, 2013, one which requires many commercial radio licensees to purchase new base & handheld radios, is the requirement for 2.5 KHz channel spacing. Previously the minimum channel spacing was 5 KHz. Since the UV5R has 2.5 KHz channel spacing, it meets the new FCC requirement. This requirement does not apply to licensed amateur operators.

You are making the antenna adapter problem too hard.
The sex of Coax connectors is always determined by the CENTER connection. The UV-5R center connection is a PIN, so it is a MALE. Thus the UV-5R antenna must be a FEMALE.
If you have an antenna with a PIN, it is a MALE antenna. To use a Male antenna with the Male UV-5R, you need an SMA Female to SMA Female Adapter like this-
http://www.ebay.com/itm/SMA-Female-To-SMA-Female-Straight-RF-connector-Adapter-/160518431131?pt=LH_DefaultDomain_0&hash=item255fa4e19b
There are NO Reverse Polarity SMA connectors used on the current radios we are discussing.
See this article if you want details on the SMA RP connectors-
http://en.wikipedia.org/wiki/SMA_connector

That's wrong! You need a SMA female to SMA female, in order to connect the Yaesu VX-7 antenna to the UV-5R. There's no maybe's about it.

Subject: [baofeng_uv5r] Re: i got the wrong adaptor

well, after a couple hours of poring over adapter web pages, i'm going to take a chance on this one:

http://www.data-alliance.net/servlet/-strse-591/Adapter-cln--RP-dsh-SMA-dsh-male-to-SMA-dsh-female/Detail

according to this info page from that site:

http://support.data-alliance.net/antenna-cable-connectors/

RP-SMA-female has threads on the outside and a pin (rather than a socket)
RP-SMA-male connector has threads on inside & a socket (rather than a pin)
SMA-female connector has the threads on the outside and has a socket

so, trusting their info, i can only conclude that you need a rp-sma male to female sma which i hope is what i ordered from the previous page.

wow! if any of you guys has actually gotten those yaesu type antennas to work on the uv5r without going through all this nonsense, consider yourself lucky. i'll report back when the adapter comes in to let you know whether i lucked out or bombed again. my head hurts.

no, none.
and this has been something that was well documented for years now, IE the change to narrow band.
One has to wonder, if one has a scinical mind, which of the big radio companies went to the FCC and had this implemented so they could sell all new radio gear and repeaters to agencies and commercial users.
There will be lots and lots of busy work over this, even if current equipment being used has narrow band capability.
Most of it does these days I think, but still, reprogramming the radios for narrow band is big dollars for techs and radio ccorporations.

What does the connector on the Visar have to do with the test on the analyzer or on a Baofeng?

The Baofeng connector and the J0125 connector are the same.

Yes, they are, but the standard of discussion in this group is the $3.79 antenna, of which there are many variants and vendors.

The other comment often made is that the radio will work with any antenna with the correct gender SMA (female) antenna, and this is obviously not the case.

If one tried to use an SMA antenna for a Motorola (and maybe other) radios, one may break the pin in the radio off if one tightens it too far. Or if they try to use this antenna on one of their other LMR radios, they could damage the finals, by transmitting into no antenna at all.

So while this antenna is ok, or at least this week it is, people have to be careful about what antennas they use on their radio.

I say this week, because Chinese vendors have been known to substitute similar products without notice, and it would not surprise me if a Motorola style antenna ends up being shipped instead of a Baofeng one.

Geoff.

I believe there was plenty of notice given, and it was not just to make
any of the "Big radio companies" happy. I believe we are running out
of spectrum in certain bands and in certain areas. By limiting the deviation
they are able to "free up" some of the spectrum.

I believe this goes back to frequency conservation from many years ago.

Originally, commercial FM equipment had a 25kHz deviation bandwidth
and was reduced to 5kHz. Now the push is on to reduce it to 2.5kHz,
but this will take place over several of years so services will
phase out their equipment gradually.

This will allow for more channels in a given spectrum.

If it were implemented in uk for commercial kit I would have lots of money to earn, narrow deviation doesn't mean anyone needs to buy new radios, just they have to have existing radios narrowed.
Don't get deviation and bandwidth mixed up, see carson's rule for this.

It's bandwidth that's changing, and the radios have to have a valid FCC type acceptance based on the new emission designator. All newer radios already have this. If they don't the radio will not usable (legally). You can't just turn down the deviation.

I bought this adapter. Like it because of the knurl center section. I have some without and they are hard to unscrew.

I'm confused with your statement. I thought a radio only had to be FCC Certified for services here in the USA like Commercial, GMRS, MURS, etc. I didn't know radios for us hams had to also have that certification.

  It's bandwidth that's changing, and the radios have to have a valid FCC type acceptance based on the new emission designator. All newer radios already have this. If they don't the radio will not usable (legally). You can't just turn down the deviation.

If it were implemented in uk for commercial kit I would have lots of money to earn, narrow deviation doesn't mean anyone needs to buy new radios, just they have to have existing radios narrowed. Don't get deviation and bandwidth mixed up, see carson's rule for this.

It's good for hams. Lots of non compliant equipment surplused off.

On Sep 11, 2012 3:14 PM, "John" <johnla@usa.net> wrote:
  I believe this goes back to frequency conservation from many years ago.

Originally, commercial FM equipment had a 25kHz deviation bandwidth
and was reduced to 5kHz. Now the push is on to reduce it to 2.5kHz,
but this will take place over several of years so services will
phase out their equipment gradually.

This will allow for more channels in a given spectrum.

What we ran into back in the day was we cranked the deviation back to 5kHz.
That worked with new receivers, but the old receivers were still broad as a barn door.
They were replaced out due to necessity.

i think this one is what i've been looking for. i think i went down a late-night rabbit hole last night and got caught up in wireless cable connectors with completely differently terms than hams use for such adaptors and connectors. unfortunately, i have a hard time even with pictures envisioning these sma connections--i know pl259 and bnc cold as those are the ones i've used all my life and they are simple in comparison.

tks for the link, i've ordered a couple of sets of these. in a few weeks i'm going to have make a trip to the scrap metal buyback program to dump all these wrong adaptors! [g]

tks, /guy (73 de kg5vt)

Yes if you want an N connector. To use your Yaesu antenna you need an SMA female barrel connector.

But it matters to non ham users of the UV-5R on commercial frequencies.

The only relation to ham is the inflow of non compliant commercial equipment into the ham community. I have an old Motorola Saber that's going to be absolutely useless commercially in January but will serve me fine as a ham. No way to narrow band it, even if I wanted to for some reason.

AHHHHH, but think about all the equipment that will be coming available as a result of the deadline!!! The market should be flooded with various types of "old" unusable Part 90 radios that HAMS can use if it will tune and align okay for HAM band use.

Sounds interesting to me :-) Bob K6WL

Sorry, the SMA-RP is NOT the correct adapter you need for this.

SMA-RP is a specially assembled SMA with the opposite part inside. These were designed for wireless routers specifically so that only the antennas designed for them would fit. This is for much the same reason that FRS radios have permanently attached antennas.

Let me say again... the Yaesu antenna, like the UV-3R, is SMA-Male. To use those antennas on the UV-5R you need a SMA Female to Female. This is the part you need. I know, because I have done this myself, personally, with my own hands. I have one of these adapters in front of me now. With it I screwed a Yaesu antenna and a UV-3R antenna onto a UV-5R. This is the exact part I ordered and it fit and worked.

This is a better SMA Female to Female connector than the one I bought due to the knurled middle piece. That will certainly make it easier to tighten and remove.

Thanks, John!

There is something to be said for using a "pigtail" connection. It's
okay to use a SMA-F to SMA-F (for example, depending on the antenna)
connector for directly fitted rubber duck-type antennas on HTs, but
using a pigtail rather than a straight-through connector is likely to
put less strain on the connector at the radio end, and is also easier to
connect by screwing in the short cable, rather than either spinning the
radio around the antenna feed cable, or risking twisting and so damaging
the coax. I have an 8" cable with SMA-female on one end, and SO239 on
the other. This allows the UV5-R to connect to the same mag-mount or
post-mounted antenna as my mobile and/or base unit (when I get one!)
most of which have SO239 connectors.

The most satisfactory solution for handheld use is probably to get a new
rubber-duck-type antenna with the correct SMA-F fitting, although there
have been various threads on this group about the possibility of buying
a dud or knock-off copy from eBay dealers etc. caveat emptor.

regards, Martyn M3MDY

I just typed this out to a local, but figured someone may find it useful:

A few pointers (quirks)
You set all the transmit parameters (the ACTUAL xmit freq, tone and power) in to a memory
and the lady will say "transmit memory"
then you program all the receive parameters (the output, and tone if you want one,
and then program that memory location again and the lady will say "receive memory".

You can not change settings on a programmed memory. It won't hold,

Memories with offsets with show +-. Power can be changed in CHANNEL mode by
pressing #. Reverse is on the *. To see the frequencies you've programmed and
not be confused by the repeat on the display, set menu items 21 and 22 to FREQ.

there will be some yep.
however, the old, used and obscelete markets for conventional analogue VHF and UHF radios is pretty slim right now.
Compared to 5 years ago anyway.
It goes in cycles.
Just think of your local public safety agencies over the past 30 years.
Many of them have changed frequency bands 3 or 4 times and every time they do, old radios become availible.
same true with many different fleets and companies.
from 35/42MHZ, to VHF, to UHF, to 8 or 900MHZ trunked systems.
things change and progress, and us hams reep the benefits.
there won't be a flood, but there will be somewhat of an influx of radios.

received 09_06_2012 from sain store via amazon:
http://www.amazon.com/gp/product/B007H4VT7A/ref=oh_details_o04_s01_i00

model: uv-5r
color: black
ver(3): bfb251 (
ver(6): 120722a ver-05
note: does not appear to have fm-radio memory.
note: does have clear english voice option with only faint accent
note: embossed antenna
note: very minimal audio at lowest volume pot setting
note: no performance data yet. still learning functions

Hey all.
I have not been watching this thread for a while. I wanted to hold out till the bugs were worked out. From the little bit of reading I have done today, there has been some good progress and that is awesome. I have some cash now. I just got paid today :D
The money is burning a hole in my pocket.
My question is:
What vender would give me the best chances at getting one of the most up-to-date and trouble free UV5R ?
One more question. Is it still tricky to program by hand?
I ran in to a problem once on a public service event with another HT where the repeater we were going to use added a PL tone and it was not listed in the repeater directory. I had to hand program them in and I would like to be able to do that with the UV5R too. I was hoping that with firmware updates this may have got more easy. Just hoping :-)
Thanks all.

Thanks Dave.
I'll get started as soon as I am done typing this.
As a rule of thumb for me, I never purchase a HT that I can't program by hand.

Eric,
IMHO, I would consider Import Communications. www.uv5r.com
I know he has the latest model and firmware.
Nice to have a warranty here in the US.

Eric,

I think most of the product ships through the "stores" quickly enough that you will have the latest version unless you order a color other than black. The colors may be older stock.

I've had one since April and purchased another in July.... only very minor differences that I can see. Even the latest don't seem as though there is any significant change from the original. What you perceive to be easier is really that we have become more versed on the UV-5R and some of the tools and instructions have made it loads easier for the newbie.

If you want yours quick I would consider a US store and I would think that any warranty issues would be easier to deal with. If you want cheap then order from a Chinese store and wait.

As for programming from the keyboard, it has not gotten easier, the instructions from the Group make it easier. Still the preferred method is via software BF or CHIRP or both.

Come on in , the water is fine !

Eric,

I think most of the product ships through the "stores" quickly enough that you will have the latest version unless you order a color other than black. The colors may be older stock.

I've had one since April and purchased another in July.... only very minor differences that I can see. Even the latest don't seem as though there is any significant change from the original. What you perceive to be easier is really that we have become more versed on the UV-5R and some of the tools and instructions have made it loads easier for the newbie.

If you want yours quick I would consider a US store and I would think that any warranty issues would be easier to deal with. If you want cheap then order from a Chinese store and wait.

As for programming from the keyboard, it has not gotten easier, the instructions from the Group make it easier. Still the preferred method is via software BF or CHIRP or both.

Come on in , the water is fine !

Subject: [baofeng_uv5r] Question Please?

Hey all.
I have not been watching this thread for a while. I wanted to hold out till the bugs were worked out. From the little bit of reading I have done today, there has been some good progress and that is awesome. I have some cash now. I just got paid today :D
The money is burning a hole in my pocket.

My question is:
What vender would give me the best chances at getting one of the most up-to-date and trouble free UV5R ?
One more question. Is it still tricky to program by hand?
I ran in to a problem once on a public service event with another HT where the repeater we were going to use added a PL tone and it was not listed in the repeater directory. I had to hand program them in and I would
like to be able to do that with the UV5R too. I was hoping that with firmware updates this may have got more easy. Just hoping :-)
Thanks all.

While exploring the issue of the UV-5R type acceptance for non ham use, I found the following in the FCC database.
https://apps.fcc.gov/tcb/GetTcb731Report.do?applicationId=392511&fcc_id='ZP5BF-5R'

towards the bottom, it shows the VHF/UHF testing and gives an emission designator of 9K10F3E for 136-174, and 9K20F3E for 406-480.

A search of the 9K10F3E I found a pdf test report on line from the test company, Shenzhen Timeway Technology Consulting Co., Ltd. But I lost that link and cant seem to find it again.

The FCC report above shows reference to part 90, 95, and 97.
I don't know what this means, maybe someone more savvy can explain.

Hope this helps in the discussions of compatibility.

7861. Issue with Microphone Jack

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-12 13:57:59 UTC
From: lavrivstefan
Topic: 7861 Message: 7861

Hello all,
I want to inform you interesting experience with my Baofeng UV5R. I got USB cable and I started programming my UV5R. After finishing programming I took cable out of my walkie-talkie and in that moment I lost my Modulation. After dissembling walkie-talkie I discovered that Microphone switch located inside microphone jack didn't connect back internal microphone. After playing with needle around the contact pins inside microphone jack I finally made the contact and it is working now. It was long battle (It took me 3 hours to disassemble and troubleshoot). Especially sticky is putting display back, since rubber contacts are very sensitive, so if you don't put it right way you lose some dots on display.
Now I am afraid to add more Channels and Channel names into UV5R. If you use CHIRP software you can put 7 Characters into channel name. With original Baofeng software you can program only 6.
I like adding names to channels, since it remind me to which repeater I'm using.
I like this UV5R since it is only device I know which may work on booth UHF FRS bands in AU and USA. I travel to AU and I'm using them a lot. Also it supports repeater work on both FRS band in booth countries. I have device with extended battery pack and longer antenna.
Regarding local HAM repeaters it works well, no issues to report, except lights on display are funny, some time not turning on at all, sometime wrong light but "who cares" about that anyway.

Congratulations Horacio, sounds like you had a good time!

I have a six element "beam" hanging in my garage; its made from a piece of scrap wood and the elements are copper wire. The plans for it came from the internet. Once a year I take it out, put a short pole on it, and attach it to the top of a step ladder... that gets it about 10ft off the ground. The coax is about 15ft of RG6; it gets me comfortable at a table in the yard and gives me a spot to put a cup of coffee. Lots of fun, even with my handheld and a couple of watts!

Not every "contest station" need be expensive with lots of power!

Okay, I see what you are getting at, but this is a different subject, that being of connector compatibility.

I have several radios that use a female SMA connector on the antenna side. Vertex VX-10, GE/Ma/Com, Uniden and Motorola Visar.

Just for the subject matter you brought up, I do know that the compatibility between the Vertex, Visar and the Uniden or GE by Uniden definitely have the problem you mention. I do have all of these units on hand and can check the differences in connectors if needed.

However, the antennas that were tested are the J0125 from China.

Hi lavrivstefan

Thank you for the heads up on this problem.

When you say <I got USB cable ... > Is this the one sold by Baofeng or some 3rd party vendor? Did you try other USB cables, perhaps the original cable manufactured and sold by Baofeng? Can you tell us what model number or vendor made your cable so that we can avoid buying one of these defective cables?

When you say < I took cable out of my walkie-talkie...> Did you use the Safety Remove Hardware and turn off the Handi-talkie before you did this disconnect? Its always recommended that you take this extra easy step when working with USB devices.

When you say < I discovered that Microphone switch located inside microphone jack didn't connect back internal microphone. > are you describing a mechanical problem that might be affecting your particular radio, or a problem that is a design flaw of the brand and model? Where you able to duplicate this problem with other radios or attachments?

Thanks for the heads up and for the clarifications.

Hi all,

I have the UV-5R and have discovered a peculiar thing about this rig. I have measured the output both high and low (5.5 watts high 1 watt low)with my Bird wattmeter and when the antenna is attached I can hardly get in to any repeaters when on high power but much better on low power!! I have tried this with several 2 meter repeaters and it is the same problem. Is it possible that the antennas on these rigs are wrong and maybe introducing high swr that is more prevalent on high power? The high/low works properly on UHF with the high power much better to access repeaters. Has anyone else noticed this?

I believe it's a stand alone file. If it's not listed under your 'add/remove programs' list, then it should be just that one file/icon. Right click on your 'BF5R_CPS' icon; if its listed as an application, file size about 1.8mb, just delete it.

If you search this group for "mic" you will find several have had the same problem with their UV-5R audio jack failing to return to internal after unplugging their external speaker mic from it, (you just happened to experience it with the USB cable). The most common suggestion so far has involved simply replugging/removing the mic multiple times until it started working again. After a while the problem seems to simply go away from what I have read. (Another "solution" is to blow in compressed air but not certain I agree with that).

I have not personally had that problem with this radio, although I have experienced the same thing with others, plus an old Palm Pre+ cell phone. In every case, simply working the jack with the external plug for about a minute seemed to break it in and each device worked in the expected fashion afterwards.

Your mileage may vary....

How are you verifying that you are getting into the repeater? If you are using a nearby HT, your high power Tx may be desensitizing the HT Rx.

That stuff works good at VHF and UHF because it's designed to!
You can lose more then the 3% of a 1.5 SWR just at the match point.

Serial 201204R44732
Received 12 Sept 2012
3 Key BFB251
6 Key 120722A
vendor Amazon.com (CKnapp Sales Inc.)
Model UV-5R (Black)

Now, to figure out how to program this thing. (I have Chirp, just need to play with it)

why all the questions about the programming cable?
He didn't say anything about a defective cable.
Just that once it was disconnected, the internal switch didn't reconnect the internal mike.
This is actually more common than most people realize with all HT's.
Do as suggested and it usually solves the problem.

the uv3r has measured between 2 and 3 W on high on VHF and UHF on most tests
I've seen.
so the seller can choose to round up or down as per their marketting whims.

Regarding Chirp - need to make sure you have one of the packages from "Daily Builds" loaded to have it cover your new UV-5R. (You probably already know that, but "just in case" thought I'd mention it).

Ok.. first off I tested the transmitter wwith a Bird 43 wattmeter in to a dummy load NOT the rubber duck antenna. I also tested it with a dual band Diamond on my tower and it works fine. The transmitter when in the 145 region shuts down on high power with the supplied antenna. It seems ok on the 146/147 region. I am thinking that this antenna may be wrong. It works correctly on UHF also. Just in the 145 section is where the problem is. It has nothing to do with PL or anything like that. It acts like there is high swr on the rubber duck down on the 144/145 area.

I have measured the output both high and low (5.5 watts high 1 watt low)with my Bird wattmeter and when the antenna is attached I can hardly get in to any repeaters when on high power but much better on low power!! I have tried this with several 2 meter repeaters and it is the same problem. Is it possible that the antennas on these rigs are wrong and maybe introducing high swr that is more prevalent on high power? The high/low works properly on UHF with the high power much better to access repeaters. Has anyone else noticed this?

Yep, I got the latest build and I've programmed a couple channels in, one of them is the repeater that's about 5 blocks from me on top of a big apartment building. ;) I've been listening to some traffic but there's not a whole lot out there (that I can find at the moment).

I haven't taken my test yet so I can't Xmit but I'm looking forward to doing so in the next week or two. If I can get my girlfriend to pass her test too I might buy her one of these of her own. :)

I got out my field strength meter aand confirmed what i suspected. Above 146.55 the ardio works fine on high power showing an increase between low and high. In the 144/145 area the radio on HIGH power the transmitter blips on for a split second and then shuts off. Indicating that there must be high swr on the rubber duck antenna. This does not happen using the Wouxon antenna! With the Wouxon antenna it works fine on all vhf and uhf.

Any ideas??

Sounds like the display wasn't assembled properly. There was someone recently discussed taking his apart for another reason and talked about how care was needed in re-assembling the display to get it all segments to function.

Good luck on the test. What class are you shooting for?

If it is technician class, once you pass, ask to take the general class test. I don't think it costs you any more and you just might pass.

Thanks!

I'm taking Tech (and confident I'll pass now), now I start studying
General until the test date. I will shoot for General. ;)

Extra involves a lot more theory and math... I do want it though.
(I'm actually interested in being a VE)

Thankk you for your update. I tryed to wiggle the jack but just 5-6 times with no luck. So Problem is fefinetely mechanical for all other users with software bacground.

--- In baofeng_uv5r@yahoogroups.com, "w6tux" <w6tux@...> wrote:
>
> If you search this group for "mic" you will find several have had the same problem with their UV-5R audio jack failing to return to internal after unplugging their external speaker mic from it, (you just happened to experience it with the USB cable). The most common suggestion so far has involved simply replugging/removing the mic multiple times until it started working again. After a while the problem seems to simply go away from what I have read. (Another "solution" is to blow in compressed air but not certain I agree with that).
>
> I have not personally had that problem with this radio, although I have experienced the same thing with others, plus an old Palm Pre+ cell phone. In every case, simply working the jack with the external plug for about a minute seemed to break it in and each device worked in the expected fashion afterwards.

> >
> > Hello all,
> > I want to inform you interesting experience with my Baofeng UV5R. I got USB cable and I started programming my UV5R. After finishing programming I took cable out of my walkie-talkie and in that moment I lost my Modulation. After dissembling walkie-talkie I discovered that Microphone switch located inside microphone jack didn't connect back internal microphone. After playing with needle around the contact pins inside microphone jack I finally made the contact and it is working now. It was long battle (It took me 3 hours to disassemble and troubleshoot). Especially sticky is putting display back, since rubber contacts are very sensitive, so if you don't put it right way you lose some dots on display.
> > Now I am afraid to add more Channels and Channel names into UV5R. If you use CHIRP software you can put 7 Characters into channel name. With original Baofeng software you can program only 6.
> > I like adding names to channels, since it remind me to which repeater I'm using.
> > I like this UV5R since it is only device I know which may work on booth UHF FRS bands in AU and USA. I travel to AU and I'm using them a lot. Also it supports repeater work on both FRS band in booth countries. I have device with extended battery pack and longer antenna. Regarding local HAM repeaters it works well, no issues to report, except lights on display are funny, some time not turning on at all, sometime wrong light but "who cares" about that anyway.

I once thought that, but then we lost power and I had my radio with me (not a rare thing) and nothing around me resembling a flashlight. I was able to find my way to the flashlights with my radio.
The FM was nice to listen to, my children needed some entertainment.

An the going out aspect, I would think a few things. LED are supposed to last a long long time, but it's possible it's failed. Another possibility is the solder breaking loose from the board. A third is the actual button that controls it is busted off the board (which has happened to my PTT button. All three buttons are identical inside the case.

Does the other function that the button doubles as work? Make sure you're broadcasting locally and not over the air checking.

Hope some of this helps,

73

I've carried a real flashlight in my pants pocket for over 20 years. I don't need a toy one on my radio. I can't count the number of times I've accidently turned on the flashlight while putting the radio on my belt only to have my wife tell me the flashlight is on.

So if you need a "toy flashlight", go for it.

One test I have from a personally very well respected tech, shows very bad
SWR on most of the VHF band from the stock uv5R antenna.
in the order of 10 to 1 swr.
My own practical experience through observation says the antenna doesn't
work nearly as well on vhf as it does on UHF.

has anyone cut open the stock duck to see what it's made of?
I suspect it's a coil.

Thanks to the Miklor site I was able to get my UV5R programmed last night without any real problems. In addition I didn't have any driver problems as I have an XP machine. I have two of the $3.79 antennas (Now $3.99) on the way and I will see how they work when they get here.

i didn't even bother testing this one, it had a quality problem right off the bat. the antenna was de-centered from the connector so that when you tried to screw it onto the radio it moved elliptically.

oh well, sometime you _do_ get what you pay for ...

Your output power at 5.5 watts is suspiciously high. If it is that high then it is not surprising that the radio is experiencing a fault condition such as overcurrent. An HT should not be that sensitive to SWR as in practice it will vary a lot according to the conditions in which it is used. If you could turn the power down I suspect it would give you a lot more tolerance of different antenna conditions.

>
> I got out my field strength meter aand confirmed what i suspected. Above 146.55 the ardio works fine on high power showing an increase between low and high. In the 144/145 area the radio on HIGH power the transmitter blips on for a split second and then shuts off. Indicating that there must be high swr on the rubber duck antenna. This does not happen using the Wouxon antenna! With the Wouxon antenna it works fine on all vhf and uhf.

Exactly, and even zero dBd is impossible to accomplish with typical helicals.

Minus 3 dBd to minus 6 dBd would be more accurate.

I have one. Both internal design and power output are identical to the UV-3R. Harmonic suppression is as bad as the UV-3R, too.

They also sell the UV-200. Same story.

I made a small squelch input level test (using a calibrated HP 8647A RF generator so should be accurate enough), comparing my 281 and 251 UV-5R, and also my Icom IC-R2.

1kHz FM modulation was used.

http://f1.grp.yahoofs.com/v1/0NhRUNiUX5VxIOObF9tleeOG2ga_DGrfHZs_Z-vPgD7kpbJvaQmRx2xQWZF2TtRq0wh-gJJp4kSafqkxhMjYtXG6np52kqI/input_level.pdf

As you can see my newer uv-5r is less sensitive on UHF, but that's probably more of a hardware diffrerence than firmware...

Hi Horatio!

The following links are to the same article, but one version is updated. Both are useful.

www.repeater-builder.com/antenna/pdf/cheap-yagis.pdf

http://www.wa5vjb.com/yagi-pdf/cheapyagi.pdf

The design evolved to help out amateurs in Cuba because of the scarcity of advanced materials. I built the 2m six element version; it fairly easy for one person to handle without bending the elements. My elements are made from copper wire that I work hardened by twisting with an electric drill while the other end was held in a vise. The boom is made from a single piece of scrap lumber; no reason it couldn't be made from two pieces, though. The length of the coax is only about 15ft... enough to go from the antenna driven element down to the operating area on the table. I only use this once or twice a year and most of its life is spent hanging on the wall in the garage.

I have an 8ft "A" shape step ladder that is used to hold and make the antenna easy to rotate. The very top of the ladder has a 1.5 inch hole drilled in it; the pole holding the antenna goes through this hole. I put a cross board in the ladder that goes from a step to a rung on the "A" brace; the pole rests on this board.

And that is my 2m "contest" setup. After the coffee is gone, along with the contacts, the ladder is returned regular duty and the antenna to hanging on the wall in the garage. Even have time to tend the garden between conversations.

Once a year I take it out, put a short pole on it, and attach it to the top of a step ladder... that gets it about 10ft off the ground. The coax is about 15ft of RG6; it gets me comfortable at a table in the yard and gives me a spot to put a cup of coffee. Lots of fun, even with my handheld and a couple of watts!

hey all:
just a shot in the dark, but can one import excel spread sheet files into chirp somehow?
is there a way to convert excel files into csv or img files or something so one can build your frequency list along with all required radio info and just import it into chirp and write to the uv5r?
I know that is an RT systems software feature, but just figured I'd ask here since I haven't seen it mentioned yet.

Excel will save as a CSV file, just hit "save as" and choose csv as the type.

Distance really depends on terrain. Best bet is to just try them. The repeater I use is maybe 5 miles away, and if I walk a quarter mile towards it I can see it once I get past the trees and into open fields. that's VHF. I've heard the UHF repeater that's probably 10-12 miles away clear as day. No one uses that much except for Tulip Time when the Hams help out the Red Cross. I'm not sure if I am clear or not, but it does kick back the automated message.

Welcome Harold, I'm a new ham also. Asking how far a radio will transmit is like asking how far a car will go on a gallon of gas. Are you going down o up hill, with or against the wind, etc. The same with a radio, are you inside or outside, up on a mountain or deep in a valley, out in the desert or in a highly congested urban setting, etc. An then even with all that, moving a few feet may make transmission better or worse.

Play with the radio in different locations, you'll soon figure out what works for you.

Consider this,
FM satellites radiate about 1 watt power at 450km +/- and you'll at least receive them on a small beam. But then you and a friend own identical radios and might not hear each other at 1 mile or less with 5 watts. so, how long is a piece of string.

That's true, but far from the whole story.

CSV files are really an encoding mechanism, not a strict format. If you export your XLS file as a CSV, there's about a 100% chance that CHIRP will not be able to understand it.

Do this:

Download your radio with chirp, export as a CSV file. Then you can open the result in excel and made whatever changes you want. Similarly, you can take existing Excel data and get it into the same (and I do mean the SAME) format as you see chirp exports in CSV format. Then CHIRP can import it.

Exporting any random XLS file to CSV and expecting chirp to understand it is roughly like taking your car to an unmarked pump (that looks like a gasoline pump) and assuming that, since the nozzle fits in the tank, that whatever comes out and into your car will make your it happy :)

Right, it needs to be in the same order with the headers and everything...

That's what I've done, making a copy of my original download from my
radio and modding that copy for importing.

JL,

I appreciate your suggestion as it is what I would do if I could get the "off" memory channels to export in a CSV file. Until I figure out how to do that, I am stuck editing channels one-at-time. That is a P-I-T-A!

7930. Re: Freq Unlocker

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-13 20:26:47 UTC
From: hsncorrosion
Topic: 7024 Message: 7930

HI there,

I'm still here... I only chose to release here because I knew UV-5R users would find it.

I know enough about the uv5r that I don't post much...
I didn't really think that many people would be in here asking about it so.... I didn't look until recently.

As already mentioned there are gaps in the TX and RX....
You can RX pretty high BUT.... the discriminator will prevent you from listening to things like pager data.... Not to mention the UV-5R is a FM only transceiver.... So those trying to RX anything that is AM simply won't do you any good.

I personally programmed mine with gaps as was suggested in the UHF/VHF bands.. The point was to simply allow me to enter and out of band freq... Without having to screw around with CHIRP every time I find something...

for example, if you listen on a scanner and find something that... (you have privs on of course) you could just punch it in on your radio and there you go....

The ONLY thing that has been done on this 'hacked' software is that the stops in the program that prevent you from entering out of band limits has been removed so you can enter pretty much whatever you want.....

I used it just to unlock my keypad so that CHIRP is nolonger a requirement on the UV-5R.

Anyone who needs to contact me may do so by emailing.... admin at deauththis dot com.....

I rarely check on this group....
Enjoy, good luck

--- In baofeng_uv5r@yahoogroups.com, "Jim" <rock.unroe@...> wrote:
>
> Colin,
>
> The 'Freq Unlocker' hack Instructions claim that the software allows you to program frequencies from 100-999 MHz in the UV-5R. It does not claim that all frequencies in this range are useable. In fact, the hacked VIP software comes with a "Tested Working Frequencies" document in which there are very few working frequencies listed that are outside of the range that we can already program using CHIRP. It doesn't hack the Channel Information page frequency limits, so any expanded frequencies have to be entered and programmed via the keypad.
>
> The document referenced was the so-called 'Instructions' for the hacked program which is save in the files are of this group along with the 'Tested Working Frequencies' document and the hacked VIP software.
>
> I still haven't used the software. There's probably nothing wrong with it, but to me an admittedly hacked software from someone I don't know, that apparently disappeared as quickly as he appeared, deserves some measure of caution. Has anyone taken a chance and tried this?

> >
> > Thanks for your reply mate.
> > Right....Iâ□□ve pretty much understood what youâ□□ve said there but its not quite what iâ□□m asking, if that makes sense....
> > Basicly what iâ□□m looking for is to turn my HT into a receiver with the freq 100-999 Mhz available but WITHOUT the risk of catching the PTT Button and causing an output chip to blow.
> > If I read this correct http://f1.grp.yahoofs.com/v1/ELs-UGlNAJx_849VpkubERiNl73hEZ9Zyu1YHU0eP5R1HYfj7vFZguRIWCZOiFXU_-Vz-nXzJ9uEiCN59LEl2WzN0Qh0MZs9CMbXGtUh7MNd3DETsujv2W5L/UV-5R%20Freqency%20Unlocker/Instructions I cant see any reason why I cant do it, Im just unsure as to how and where to put place the freq range i.e. 100-999 mhz. Iâ□□ve had a little time to sit and ponder the issue and iâ□□m wondering if iâ□□m meant to put in the vhf boxes 100 up to 300 then in the uhf boxes, 300 up to 999?? That seems feasible to me but it still leaves the issue regarding an accidental keyed mike.....
> > I understand what you mean about manually programming each channel to TX on 220.000 Mhz, but its not quite what I wanted to do. Iâ□□d rather punch in 100.000 Mhz then just set it to scan up through the frequencies until it found an active RX.
> > Iâ□□ll certainly keep with it as I dont like to be beaten on much lol. If I can get it to act as a scanner that covers 100 to 999 Mhz without the risk of any damage to the HT then iâ□□ll be extremely pleased with its capabilities. I think I paid Â£45 delivered and it came with a programming cable and cd (I use chirp) so really cant knock â□□em at all.....

> > I've never used the 'hacked' VIP software myself so I can't give you advice based on hands-on experience, but I might be able to give you a little help.
> >
> > Take a look at the accompanying text that shows you a list of verified frequencies. See how the list is split into two ranges? We'll call the first range VHF and second range UHF to correspond to the UV-5R's bands.
> >
> > The verified VHF range goes from 140-181 MHz and the verified UHF range goes from 380-520 MHz. Put 136 and 220 in the From and To settings for VHF0 on the VIP Other page. Then put 380 and 520 in the From and To settings for UHF0 on the same page. The Allow transmit tick boxes are ticked and greyed out on the unhacked VIP software so don't worry about them. Connect the UV-5R up to the computer and write the changes.
> >
> > With the UV-5R disconnected from the computer, manually program a VHF channel with a receive frequency between 174 and 181 MHz to see if it even works. If it does, program a transmit frequency of 220.000 MHz into the same channel. Since we know that the UV-5R won't transmit in the 220 MHz band, that should work as your TX inhibit.
> >
> > Program a UHF receive frequency like you normally would, except switch to the VHF band and program 220.000 MHz for the transmit frequency as well. So basically for every channel that you program, you will program 220.000 MHz at the TX frequency.
> >
> > Remember... I have not tried this so this is all a big SWAG on my part. Let us know if this does or doesn't work. If it does, you will just have to experiment where you upper VHF limit and lower UHF limit should be on VHF0 and UHF0. If you figure that out, let us know that too.

7931. CMIIT Number

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-13 20:35:39 UTC
From: John
Topic: 7931 Message: 7931

The question came up last week as to what a CMIIT number was.

It's the Radio Certification required in China.
http://www.omron-ap.com/standards_certification/chn_wireless.asp

We can all sleep better tonight knowing this. :-)

From: John
Topic: 7932 Message: 7933

Are you referring to a ham repeater or FRS/GMRS ?
Ham has no default channels per say.

Note: UV5Rs get very hot if continuously keyed for long periods of time.

Topic: 7934 Message: 7934

Just received my new UV-5R and wanted to program it in chirp. I downloaded the latest daily for Linux and proceeded to pick the usb port. Long story short no luck, I receive the infamous Radio did not respond. I figured it was an issue on Linux. I moved to my windows 7 64x box. I have tried every driver known. I have selected each and every driver manual and without luck. Every time on Linux or windows I receive the Radio did not respond, and the radio reboots. Any ideas at all, I really do not want to program over 90 channels by hand.
Thank you
KD0RGD

Mais um erro de projeto dos chineses :

Estando o Baofeng no modo Scan, seja no VFO, seja na banda MEMÓRIA, quando o aparelho encontra uma portadora, ele para mas o display não acende.

Somente depois que a portadora vai embora é que o display se acende ! ! !

E todos nós, usuários deste HT, ficamos sem saber (principalmente durante a noite), em qual frequencia o aparelho deu sua parada.

Isso é um erro grave de projeto.

Obrigado.

I suggest that you check out this group site. We have over 7,000 postings many of which are related to antennas of all types and prices. Simply go to the Messages section and enter Antenna in the search box.

There will be more information there than you can believe.

any ideals on a good antenna setup for this radio, i have one of the cheap ones coming already, but not sure how good it will be. i believe i would be interested in a magnet mount and another one to connect directly to the radio.

Which Linux dist are you using? Did you run "dmesg" in the terminal to see what TTY device is being used? It should be something like /dev/TTYUSB01. I got the same error when my cable wasn't FIRMLY seated.

Understood. I agree...sounds like a flaky cable but try one more thing.

Turn you radio on its side with the antenna to the right. Put both thumbs on the the connector and your fingers on the PTT side. Press with your thumbs back and forth and see if you get a connection. Its the method that works for me.

Good luck,

Steve

Long story short no luck, I receive the infamous Radio did not respond. I figured it was an issue on Linux. I moved to my windows 7 64x box. I have tried every driver known. I have selected each and every driver manual and without luck. Every time on Linux or windows I receive the Radio did not respond, and the radio reboots. Any ideas at all, I really do not want to program over 90 channels by hand.

the line in the chart dated '09-jun' which reads "sain store via amazon / No fm-radio memory. Clear english voice option ..." should be the date of 09-sep.

tks for maintaining this chart--it's extremely helpful.

very sorry--i still messed it up on the re-try. should be date of: 06 sept 2012. i forgot that european format is opposite and that 09-06 means june 9th instead of sept 6th. i should have spelled it out to be clear.

in the grand scheme of things, most likely not important ...

awesome.
Thanks for that.
I thought I vaguely remembered something about csv and excel, but never
payed attention before now because I never had a radio that used chirp etc
until the uv5R.
I'll give it a go.

that question is literally impossible to answer with any accuracy.
you can get general distance figures for VHF frequencies and UHF frequencies at given power levels...but again, not only geography, but antenna gain, antenna type, antenna patern of radiation, antenna SWR, proximity to objects, the receiver of the radio you are trying to talk to all play factors...among about 100 others.
Lets say for purposes of generalization, that you have two stock UV5R's with stock antennas that are, for the sake of this arguement, the same specs...On VHF, with high power, IE 4 to 5 watts depending on your particular radio, and with a, god forbid, good less than 1.5 to 1 SWR, and in say a flat urban environment, you might get 5 miles as long as there aren't too many steel and concrete buildings between you.
On UHF, perhaps the same, but it'll depend again on what is in between you.
Now, if your on the ocean, and it's a calm day, you could probably get 50 miles between two UV5r's on high power simplex.
If your flying in an airplane you could probably get 100 miles between two UV5R's with a straight shot.
Like I said, impossible to answer your question with anything approaching accuracy.

Give us some info on your area: hilly, flat, city, country, coastal, mountainous etc. Also, if you are wanting to know about getting into repeaters, that is a whole other conversation because a repeater is going to have a receiving antenna in a very high place, with probably good gain and a good pick up patern.
You can talk much farther through a repeater using a hand held than you could using simplex, non repeater communications.
I can talk 100 miles on my local UHF machine from my kitchen on low power using the stock duck on the UV5R...but if I want to talk to my buddy down the street on simplex, it's pretty sketchy...very built up urban environment near my house and lots of crap between me and him, and he's only 10 blocks away. We have trouble even on 5W simplex on UHF using the UV5Rs.
now from my base station antenna on 5 watts, with an 11DB gain antenna at 30FT, I can easily get 50 miles on UHF simplex.
hope all that gives you a better idea of the kind of info you need to supply to get an accurate or even practical answer to your question.

For reasons that befuddle I can not Export my UV-5R file to a CSV file. (Was going to help trouble shoot the .img/csv/xls issue)

The Chirp program pops up a box that says "Please Wait" "Preparing memory list" and stays there forever.

I have used older versions of Chirp and currently using the 7-30-2012 build all with the same results. I also tried a fresh load from the UV-5R to Chirp.

I joined the Chirp group but I will need to study the format before I can use it, not as user friendly as Yahoo so far.

Any thoughts?

Because the original poster was using the latest daily, I upgraded to the same version to make sure that wasn't his issue. Once I was finished with whatever testing I was doing, I reverted back to 20120730. I just now used it to save a .csv file so no issues here with either.

I agree that the chart is very helpful. Its pain to locate the latest update though... I'd recommend creating a google docs spreadsheet and linking it in the FAQ or on the front page of the group: Easy to update, always the same URL and edit can be granted to several people.

Hi Julien,

I found a JetStream duckie antenna that is a reverse sma and it fits fine. So far no problems at all with shutdown in the 144/145 region.I would love to turn down the power a bit but I have no service manual nor a schematic. Anyone have a clue as to if there is a variable pot to adjust power level? Otherwise I love this little radio!

>
> Your output power at 5.5 watts is suspiciously high. If it is that high then it is not surprising that the radio is experiencing a fault condition such as overcurrent. An HT should not be that sensitive to SWR as in practice it will vary a lot according to the conditions in which it is used. If you could turn the power down I suspect it would give you a lot more tolerance of different antenna conditions.

> >
> > I got out my field strength meter aand confirmed what i suspected. Above 146.55 the ardio works fine on high power showing an increase between low and high. In the 144/145 area the radio on HIGH power the transmitter blips on for a split second and then shuts off. Indicating that there must be high swr on the rubber duck antenna. This does not happen using the Wouxon antenna! With the Wouxon antenna it works fine on all vhf and uhf.

received Uv-5r today from 409shop.

model: uv-5r
color: black
ver(3): bfb291
ver(6): 120822n B5R0001
note: does not appear to have fm-radio memory.
note: does have clear english voice option with only faint accent
note: long antenna like. Not the normal one

Let me suggest either of these two ways to do this:

http://www.ebay.com/itm/160518431131 SMA-F to SMA-F

plus

http://www.universal-radio.com/catalog/hamantht/4513.html Associated SMA-M to SO-239

or

This

http://www.ebay.com/itm/220986845024 SMA-F to BNC

plus

http://www.universal-radio.com/catalog/hamantht/4512.html Associated BNC to SO-239

These pigtails are 4' long, very thin, light, and low loss LMR-100. So you don't have the weight and stress of the coax and adapters on the radio. I use the second pair, the BNC connection.

Paul - AE5JU

7966. does anyone have a formatted CSV file

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-14 05:05:05 UTC
From: Colin McDonald
Topic: 7966 Message: 7966

Ok, I am getting the please wait, getting memory list message too...which doesn't go away for at least half an hour that I waited for it.
This is when I try to export radio info to a csv file in chirp.
I need to know how that spread sheet should be formatted obviously before I can make one up to import into chirp and write to the radio.
I looked in the files section and there is no CSV example to look at.

I imagine you have already checked that the hole in the case in front of the mic is clear, Steve? Some have found extrusion faults in the plastic case with most brands of Chinese radios, from time to time.

That might be risky. My suspicion is the problems are caused by poor quality control. So I doubt very much that your antenna is the same as mine in which case lopping off the same amount I did is not going to have the desired effect.

Can't you find someone at the local club or whatever who has an antenna analyzer? (Our club has one members can borrow.)

I'm wondering if the "UV-5R schematic" in the files section really is for UV-5R?
At least the spk/mic in/output does not match the other pinouts I've seen on the web...

7980. MONITORING A VHF/UHF FREQUENCY WHILE LISTENING TO FM BROADCAST TRANSMISSIONS

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: Neil_L_Robertson
Topic: 7980 Message: 7980

In case anyone hasn't noticed (I should have weeks ago) if you tune the receiver to a VHF or UHF channel and switch to FM broadcast reception then you can listen to entertaining stuff (music etc!) until a signal pops up on the selected UHF or VHF channel. When the signal disappears FM brodcast reception is restored after a delay set by Menu 6 (ABR) Display Illumination time.

I don't know if that is the 5R but the spkr/mic looks about right. Here is the standard Wouxun/Kenwood/UV-5R pinout:

3.5mm Plug Programming Pins
Sleeve- Mic â□" (and PTT) Rx Data
Ring- Mic +
Tip- +V

2.5mm Plug
Sleeve- Speaker â□" (and PTT) Data GND
Ring Tx Data
Tip- Speaker +

Connect Sleeve to Sleeve for PTT

Hi Steve- FYI if your antenna fits a 5R it is an SMA FEMALE, not a Reverse SMA. Reverse SMA connectors are not used on HTs and will not mate (no center mate) with regular SMA connectors. I mention this to help others avoid buying SMA RP adapters thinking that 'Reverse' fits.

In fact, the hacked VIP software comes with a "Tested Working Frequencies" document in which there are very few working frequencies listed that are outside of the range that we can already program using CHIRP. It doesn't hack the Channel Information page frequency limits,

so any expanded frequencies have to be entered and programmed via the keypad.

> > > > Ive just received my UV-5R and so far so good, im having alot of fun learning its capabilities. As I have not applied for my Ham Licence yet Im not using it as a transciever and would like to know how the unlocker enables the HT to rx 100-999 mhz? I've managed to successfully patch the HT to the extended 2 mtr and 70cm frequencies but wondered how you input the freq 100-999? Where do you put these numbers? There is obviously 2 band 'areas' in which you input the extended frequencies, which one do you put the 100-999 mhz?
> > > > Also, there are two tick-boxes which can disable the TX but these seem to be greyed out?? I cant untick them

unyet feel it is necessary to disable the TX for safety reasons. I dont want to be catching the PTT and causing a problem with my HT....
> > > > Can any one advise me please. Personally I love this HT and have had NO issues whatsoever with it! The cable works fine, it charges well, is a great size, sounds brill etc etc. Up to now I really cant fault it. Now to register for my foundation licence and get some experience at our local Ham club.... :O) I've not attended just yet as ive been busy so relying on you peeps to help me with this little issue ive come across.

Maybe you have discovered something different about the 5R. I had two of them and as I remember they worked OK with my Kenwood Spkr/Mic but maybe I did not actually try them with the Kenwood mic. I sold both so can't try a test.

John
You are correct.
By Definition, SMA RP, the RP stands for Reverse Polarity.
The outer shell of the connector is the same, but the Male/Female
pinout is reversed. (reversed pin).

Why do I sense an FAQ Aftermarket update coming?> :-)

Subject: [chirp_users] Chirp on a MAC - works great!

I am successfully using Chirp on a MacBook Pro to program Baofeng UV-5R and Wouxun KG-UVA1 radios. I am using the latest daily builds, currently CHIRP daily-20120912.

I am using an unknown cheap EBay programming cable. The only quirk I have found is that the software will only read from or write to the radios one time. You then have to unplug the cable, plug it back in, and it will work again for another time, a trivial inconvenience. I do not have this problem using the same cable, same build, on a netbook running Windows 7.

The Chirp software is great and I especially like the ability to query frequency data bases for area repeaters, as I travel quite a bit.

7991. Gotten Into Real Problem

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-14 18:49:28 UTC
From: Bob Martin
Topic: 7991 Message: 7991

I think I need to reset radio to Memory 40 as it is displaying VHF on both bands and no longer programming frequencies into memory. I get into Menu 40 and hear the voice but can't enter the (1) to get total reset. After a brief time I hear "cancel." Tried shifting A/B and even BAND. I want to like this radio but certainly have had problems. I'm not retarded but probably not as capable as when I completely programmed both my 746Pro and Yaesu 2800.

http://hamgear.wordpress.com/2012/04/04/review-baofeng-uv-5r-part-i/
☐There are 9 settings for the squelch threshold, but changing it
doesn't make a difference. Whatever the setting, the Baofeng wakes
up at -129dBm on VHF, and -126dBm on UHF. Under normal conditions the
default squelch threshold seems to be just right, but in a noisy
environment this bug might haunt you.
☐The same is true for the VOX sensitivity. It doesn't matter
what setting you choose, the sensitivity stays the same.
☐Receiver is NOT off frequency

I have tried 3 different computers Vista 32bit / Vista 64bit and Windows 7 worked once on each of the 32 and 7 version twice on 64 now nothing on any of them... I am tired of spending hours messing with it, if it comes up it changes all my memories up and I spend an hour correcting them... it's programmed and as for editing them I will learn to do it manually - to bad but this stuff has left a bitter taste on the rig.

I had tried both versions, the one with 'VIP' in the title and the 'BFUV-5R'. The 'VIP' wouldn't let me do 2.5khz step, and the 'BFUV-5R' doesnt have the 2nd option tab that controls the DTMF and power on message but does do 2.5khz. I kept that one, but mainly use chirp.

If you are not going to use it, it won't hurt to just ignore it, unless you are going to put an udated version of it on.

Just a normal UHF Repeater but after getting the radios I'm thinking just 2 UHF's and where the RX LED is on the receiving unit is that can drive a relay board which will in return do the PTT on the transmit unit.....Better than VOX for sure and WAY easier aswell

You could make a Cross Band repeater with TWO 5Rs, but they are not really designed for the duty cycle of a real repeater. Previous postings have outlined repeater connections between 5Rs.

All

I have been using this for years, but if want to know just how far you can talk, you might want to take an evening to learn how to use Radio Mobile.

http://www.g3tvu.co.uk/Radio_Mobile.htm

In the past, you would have paid tens of thousands of $$'s for a tool like this. Now it is free. The only cost is the learning curve. While not plug and play, it is very feature rich. And the software is free.

I bought the eBook from Ian's G3TVU for $20, as it was a LOT of work for him, and I found it very helpful.

http://www.g3tvu.co.uk/Radio_Mobile_Handbook.htm

You can use it for charts to see what your repeater coverage will be, or even point to point communication. Very informative.

Mike va3mw

p.s. Maybe another item for the FAQ.

You'll need to add a band pass filter in front of the receiver as the front end is too broad. If you don't, the desense will really kill your range.

My VIP software allows setting 'Step Frequency' to 2.50 KHZ. The 'Step Frequency' setting in the Baofeng software really doesn't matter because it has nothing to do with programming. All it does is sets default setting for Menu 1 and is only effective the first time you use Menu 1 after uploading to the UV-5R. After that Menu 1 stays at whatever it was changed to last.

The Baofeng software is a program written in VB6. Most of the installation is just making sure that the correct VB6 files are installed in your computer (for most computers now, they already are). If one wishes to uninstall the Baofeng software and the option is not available in the Control Panel's program uninstaller, then just find the folder it was installed in (mine is '5R_CPS' in the 'Program Files (x86)' folder) and delete the folder.

you literally have to be a quarter inch or less from the hole in the case
for it to be average audio.
I put my lips pretty much right on the front of the radio to obtain average
audio...I tend to talk quiet on the radio as well, which doesn't help.
the speaker mike is exactly the same thing...low audio if you are more than
half an inch from the mike hole.
Using the same speaker mike on the th f6a yields much louder tx audio, so
it's obviously the uv5r firmware that is limiting things.

Sorry. But you have misplaced bitterness. The problem is not with the rig.

It sounds to me, from what you describe, is that you have a defective programming cable. That same cable will also program other brands and models of radios. If you do in fact have a defective cable, you would not be able to program any or those radios either.

There appears to be quite a few cables out there that the manufacturer has done a poor job of soldering the wires from the radio plug end of the cable to the circuit board in the USB end of the cable. Some have apparently shorted out and caused the circuit board to overheat. There is a picture in the files area (USB cable end.jpg) that shows what a defective cable looks like after the shell was removed.

I have ordered one of those $2.39 USB to TTL breakout boards and will try to make up my own non-Prolific chip programming cable. If I am successful, I'll be able to describe how others can make their own programming cable (of fix a defective one) and completely eliminate the prolific headache (pun intended) at the same time.

I agree, the intermediate thin coax appears to be a better solution.

8010. Antenna gets rather warm on high power

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-14 22:53:33 UTC
From: cdruhl
Topic: 8010 Message: 8010

Hello, All

Very good radio for price! I get good signal reports.

There is one repeater which I have to use high power to access and when talking for more than a few minutes, I notice that the stock antenna gets warm near its base. Is this okay? I gather that this is the finals getting warm?

BTW, two of my Wouxun accessories fit (data cable, speaker mic) and my Diamond SRJ77CA reverse SMA Wouxun antenna works as well, and fits nice.

FYI- Your Wouxun antenna is a FEMALE SMA, not a 'Reverse'. Reverse SMA is a completely different connector type and they are not used on HTs.

I will second Jim's statement. I have had my "Base" UV-5R start to act up during a long QSO cycle of maybe 25%RX /75%TX... I know I souldn't hog the mic, but I try to answer the question.... in detail.

My unit would drop out and re-start like when you reach the TOT setting. I am hooked up to a Flexible Slim Jim with a 1.75:1 match or so. The radio and antenna connection got HOT to the touch and so I had to back off the QSO. This was over a 25 - 30 min period which would give me as much as 22 minutes of transmitting.

I would not think the UV-5R would serve well in a continous repeater situation..... but it might solve a short term solution quite well.

You could make a Cross Band repeater with TWO 5Rs, but they are not really designed for the duty cycle of a real repeater. Previous postings have outlined repeater connections between 5Rs.

Does the Diamond get hot during a long transmission. If not, get another antenna for the UV-5R. Another Diamond or even the $3.79 special.

Not a thread hijack- just a comment. My KG-UVD1P gets pretty warm on a long QSO, but I have an outside antenna, so the warm must be the Tx heat sink.

8019. CHIRP Quirk

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-15 00:37:38 UTC
From: DavidO
Topic: 8019 Message: 8019

I have two BF UV5R radios. Both were originally programmed with the Baofeng factory standard program although the mask for each is different.

One radio (BFB230)interacts with CHIRP normally, i.e., it reads, writes and saves properly.

The second radio (BFB231) will start to download its mask to CHIRP, but at the end of that process, instead of displaying the radio's contents, it gives an error message "Value 255 is out of the range 0 to 9." This second radio will upload and download the mask used in the first radio properly.

Windows 7, 32-bit.

Any suggestions?
Thanks,
Dave

I find that with the OEM software, I have transfer issues if the lower display is selected and nearly 0 issues when the upper display is selected. There is obviously a difference at the programming port depending on the selected display.

You might make sure that both HTs have the upper display selected when trying to transfer between the PC and HT.

Everyone in this group knows this already, but I think some things just need to be said.
Jim (KC9HI), you possess not only the "Alpha Geek" knowledge of the LCR we all have in common, but several other qualities which are both rare and special.
Namely, you have an eager willingness to help anyone and everyone who has a problem, often doing front line research with your own equipment so seek out a single answer to a single question. This is aptly combined with a logical, well-ordered, and literate presentation style which is both thorough and polite. Not everyone who "knows", also "knows how to teach". You do.
You are the backbone of this group and not enough people stop to say "thank-you" after they get past their latest frustration. I'm sure I can speak for many if I simply say "Thank-you" for them.
Baofeng should have you on their payroll.
Ian

8030. Re: [baofeng_uv5r] Antenna gets rather warm on high power

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-15 04:01:10 UTC
From: Colin McDonald
Topic: 8010 Message: 8030

this little radio has very little heat sink and when you tx on high power on either VHF or UHF, the heat created by the PA has to go somewhere.
The stock antenna has quite a bit of metal in the bottom inch or so, basically that wide part at the bottom is all metal.
So yep, it'll act as a heat sink for the radio, and I don't really see any problem with that.
Also, if the antenna has any SWR going on, it'll create more heat in the finals, so it'll warm up more than an antenna with a 1:1 swr.
The UV3R actually has more metal that acts as a heatsink, so it doesn't get as hot...taking into account it's lower output, this would be kind of obvious...but I've made some pretty long transmissions on high power on the uv3r and it doesn't get nearly as hot as say transmissions of half that length on the UV5R using the low power setting.
Try to keep your talk time down and let the radio cool off if it gets too hot to touch lol.
Of course, if you use a 3600MA battery, you can tend to get pretty long winded as that battery seems to last forever.

it's funny you should say that because ...

... i want all my channels set to low power. i had 'em set to low on the radio, but when i uploaded the radio to chirp it changed them all to high (in the chirp /power/ column and i had to (well, i didn't have to, as we'll see ...) change them all back one-by-one as i cursed under my breath knowing that most radio software lets you click the column heading and change the whole column at once.

so then i had the bright idea to export the .img file out to .csv, change all the cells there, then re-import to chirp. that's when i discovered that chirp doesn't export that column. then i tried a risky maneuver and uploaded the .img file with the /power/ column all set to 'high' to my radio. luckily, the radio ignored the settings from chirp and remained on my preferred setting of low for all channels.

so i think there is a major bug in this respect although i haven't bounced it off the chirp list since they're all still po'd at me for griping about the mac driver/connection problem/situation. but i think you can just go to the column visibility setting and uncheck /power/ and forget that column even exists and if you need to set the power, you'll have to do it on the radio.

Maybe it isn't really an antenna. It is just a long resistor!

I have never ever heard of an antenna getting warm, at least on a handheld.
I would try another antenna. That one sounds defective.

Now, I have started a tree fire will running 1000 W on 160M with the end of
the antenna in the 'wrong' place.

Thanx for the info and with the info...I couldnt think of what else I needed and the last tme I made a UHF repeater I only used 2 little 0.5W Uniden UHFs and that gave me a few Km range.Back to John's reply I forgot to mention that the UV-5R's have a transmit tme limit which can range from 15 seconds to 600 seconds and theres always theoption of scrapping a transmit radio and attatching a fan or do a case mod and a cut down north bridge heatsink (For people that dont know its on a PC motherboard)

8042. got the j0125a's (379) today

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-15 05:32:01 UTC
From: Colin McDonald
Topic: 8042 Message: 8042

Well, the two J0125A antennas arrived in the mail today.
They look great for a 3.xx dollar antenna. Construction is sound, and while flexible, they aren't a piano wire and look pretty durable.
Mine came in a small square padded envolop and the antennas were bent into about a 3quarter circle.
They both have a pretty big curve or obtuse bent in them...not sure that will completely come out, but I did flex them a bit to try and get rid of the curve from being packed in a small package.
It is mostly gone with just a bit of a curve in them now.
Reports are great on UHF and VHF. I did quick comparisons between the stock UV5R antenna, long MFJ 1715 antenna and the J0125A.
The J0125A is on par with the MFJ 1715 if not just a hair better, at least on UHF.
I have not done any proper technical tests yet.
No SWR sweeps or anything like that. Just on the air checks through a UHF repeater linked into a VHF repeater...transmitting on UHF on the UV5R on low power from my basement, and listening to my own signal on another VHF radio.
No desence or anything that way.
I am too close to the VHF repeater to really get an accurate idea of how well the J0125 works on that band compared to the other two antennas on that band.
However, this evening I was using the J0125 on UHF with high power, from a spot in the house where the stock antenna was very noisy and unreliable into the repeater. The j0125 was nearly full quieting on both tx and rx acording to the other station.
So, just some really basic practical tests, nothing scientific or technical, but it appears as though the $3.xx antenna works at least better than the stock duck, and probably about as good as my MFJ 1715 14 inch HT antenna...which cost $40.
I will have both of the J0125a's tested for swr on VHF and UHf ham freqs and post the results by the middle of next week.

8043. Re: [baofeng_uv5r] Antenna gets rather warm on high power

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-15 05:44:22 UTC
From: Colin McDonald
Topic: 8010 Message: 8043

you've obviously never used an HT antenna with a metal connecter on it.
My MFJ1715 has a partially uncovered metal connecter on the bottom, and it gets warm or hot to the touch on any of my HT's running 5 watts on longer QSO's.
Of course they get warm. You have a metal connecter at the bottom of the duck that physically touches the heat sink on the radio...the heat will naturally transfer to the metal of the antenna since the HT no matter who makes it, never has a sufficient heat sink when yapping for extended periods on 5W.
Even a rubber duck with a rubber covering that extends right to the bottom of the connecter such as on kenwood, Icom yaesu type ducks, will get warm after a while.
It's the physics, not a defect.
and the UV5R has a pretty skimpy heat sink, so the duck will probably get warmer faster than on most other HT's.
if you tx for 30 seconds, then don't tx for 5 minutes, well of course it won't get hot.
My operating practices sometimes are such that I tend to tx for say 2 or 3 minutes, then rx for 30 seconds or less, then tx for another 2 or 3 minutes...sometimes longer...I have the tot set to 600 seconds, so I can tx for 10 minutes if I want to.
This might go on for an hour or more if I get into a good fast trigger qso.
So mine gets plenty warm on both VHF or UHF...hot enough that I can't comfortably touch the metal base of the antenna.
I've got about 4 HT's from the major names as well as the baofeng's...and they all do the same thing in those kinds of conditions.

So yep, it'll act as a heat sink for the radio, and I don't really see any

problem with that.
Also, if the antenna has any SWR going on, it'll create more heat in the finals, so it'll warm up more than an antenna with a 1:1 swr.
The UV3R actually has more metal that acts as a heatsink, so it doesn't get as hot...taking into account it's lower output, this would be kind of obvious...but I've made some pretty long transmissions on high power on the uv3r and it doesn't get nearly as hot as say transmissions of half that length on the UV5R using the low power setting.
Try to keep your talk time down and let the radio cool off if it gets too hot to touch lol.
Of course, if you use a 3600MA battery, you can tend to get pretty long winded as that battery seems to last forever.

ok, so what will the radio do by default?
Currently i've got a mixture of low and high power settings on the radio.
When I create my spreadsheet using Jim's template, I won't be putting a power column in there....unless someone can direct me as to which column I can put the tx power in and what the low/high values are.
When I import that csv file into chirp, and reprogram the whole radio with that imported csv file, not making any alterations in chirp itself, what will the radio default to? High power?
Fine with me as I would rather have high tx power programmed and set the radio to low power as needed instead of the other way around.
all that said, I suspect adding a column into the spreadsheet in the right spot would allow one to define tx power settings from there.
chirp doesn't export that info when you save the info as a csv, but I suspect it will support it coming back in from a CSV file.

sorry if this is too off topic for the list.
I don't want to have to join the chirp list for one small question.

Topic: 8036 Message: 8049

i'll let someone who knows for sure weigh in on the issue since i'm just basing what i posted on a few minutes of observation and trying to determine how chirp is handling the /power/ column. i do know for sure that an export to .csv doesn't export the /power/ column because i immediately tried that when you asked the question, but, from what i can tell so far, i think the radio and chirp default to /high/ and since i want everything to default to low, i'm struggling with the software.

i want to say that chirp ignores the /power/ column when it sends to the radio, but that doesn't sound quite right either because i could swear i've toggled a power field and the change showed up on the radio. unfortunately i'm nowhere near my setup now or i'd be glad to clarify matters. i'm old and my memory is not what it used to be, if it ever was ... As I mention in another post,my 5R has been replaced.
On a local to local check this morning, the other station reported tx audio sounded ok! - I connected my Spkr/Mic and tried again, same result, sounds like maybe the later 5R's have better Tx Audio??

For Info Only:
(3)= BFB251
(6)= 120702 - ver 05

73' - G8CAU - G8CAU

Plenty of info on the web about making home-brew amateur antennas...
Google is your friend. Any half-wave antenna will be ground independent.

I see at least three variations on their website: UV-5R UU, UV-5RE, UV-5RB

which one did you buy?

Just build a dipole, center feed it and hang it vertically.

Why not build a quarter wave with 4 radials. At UHF frequencies, it is
very small. You can build it on a UHF type connector.

Watch this

http://www.youtube.com/watch?v=cFp8CYLfq0c .

Not only do I agree per my previous post:

"My unit would drop out and re-start like when you reach the TOT setting. I am hooked up to a Flexible Slim Jim with a 1.75:1 match or so. The radio and antenna connection got HOT to the touch and so I had to back off the QSO. This was over a 25 - 30 min period which would give me as much as 22 minutes of transmitting."

My stepdad was in the Phillipines as a radioman and often talked about the heat build up was enough to "cook meals" which is probably where that statment came that is on the bottom of the charger base.....JL

From: Colin McDonald <blulemon@...>
To: baofeng_uv5r@yahoogroups.com
Sent: Saturday, September 15, 2012 1:44 AM
Subject: Re: [baofeng_uv5r] Antenna gets rather warm on high power

you've obviously never used an HT antenna with a
metal connecter on it.
My MFJ1715 has a partially uncovered metal
connecter on the bottom, and it gets warm or hot to the touch on any of my HT's
running 5 watts on longer QSO's.
Of course they get warm. You have a metal
connecter at the bottom of the duck that physically touches the heat sink on the
radio...the heat will naturally transfer to the metal of the antenna since the
HT no matter who makes it, never has a sufficient heat sink when yapping for
extended periods on 5W.
Even a rubber duck with a rubber covering that
extends right to the bottom of the connecter such as on kenwood, Icom yaesu type
ducks, will get warm after a while.
It's the physics, not a defect.
and the UV5R has a pretty skimpy heat sink, so the
duck will probably get warmer faster than on most other HT's.
if you tx for 30 seconds, then don't tx for 5
minutes, well of course it won't get hot.
My operating practices sometimes are such that I
tend to tx for say 2 or 3 minutes, then rx for 30 seconds or less, then tx for
another 2 or 3 minutes...sometimes longer...I have the tot set to 600 seconds,
so I can tx for 10 minutes if I want to.
This might go on for an hour or more if I get into
a good fast trigger qso.
So mine gets plenty warm on both VHF or UHF...hot
enough that I can't comfortably touch the metal base of the
antenna.
I've got about 4 HT's from the major names as well
as the baofeng's...and they all do the same thing in those kinds of

conditions.

Colin,
I have spent some time this morning doing some testing. I have saved .csv files for both my Baofeng UV-5R and my Kenwood TH-F6a. The template format is exactly the same.

CHIRP is a multi-bramd, multi-model programming software. It has the capability of swapping channel setups between brands and models using CHIRP's export/import feature. My guess is that because of this versatility, only the necessary and/or common details to most makes and models are exported and imported (frequency, shift, offset, ctcss, etc.).

Your are correct. Power level is a channel specific setting. But it is also a setting specific to the UV-5R. Neither of the downloaded layouts from my Kenwood TH-F6a and my Icom IC-Q7a have a Power column. I suspect that this is typical and probably why Power didn't make it into the .csv template.

I would suggest submitting a 'bug' to the CHIRP development team asking to have this column added to the export/import template. Maybe they just need a request to bump it to a higher position on their priority list.

Yes, the 5 Watts of heat has to go somewhere and be disappated.

There was an article in QST about measuring the RF power out of a radio by heating up the water in a cooler and calculating the amount of energy required to do that.

If it was just the antenna that was hot, I would be concerned. If it is the radio body getting hot and the antenna trying to help cool it off, then that is normal.

It is a small radio. The entire case is the heat sink.

Guy,
I don't have a Mac, so I can't help you there. I am using Windows 7 64-bit here. I 'download' from my UV-5R using the last three daily releases and also the version the I currently use on a daily basis, v20120730. Every channel that I can TX on is set to Low and every channel that TX is inhibited is left at the default High setting. In all 4 CHIRP versions, my power settings were retrieved exactly as they are stored in the radio.

As Colin pointed out, the power level setting is stored on a per channel basis. Once a channel is saved in the HT, it cannot be edited (in other words, menu 2 (TXP) is inhibited). You can temporarily toggle the power level in channel mode with the [#] key. But this 'trick' only works if menu 7 (TDR) is set to OFF.

Colin,
I added a Power column this morning and the best I could tell was that it was ignored. I even swapped the order of the Duplex and Offset columns and CHIRP wasn't foiled. My guess is that CHIRP only pays attention the to columns that is specifically knows about during the export/import process and ignores the rest.

I'm curious. Why are you wanting to use .csv files over the .img file that does store the power level setting and lots of other UV-5R specific settings?

Ian,
Your check is in the mail...

...no seriously. When I got up this morning and read this, I was flabbergasted. Such a nice compliment.

I want to take a moment to point out that I am not alone in this. There are several individuals, yourself included, that provide help to new, potential and long time UV-5R owners. I wish to thank all of you that provide the short and quick answers to questions which makes it possible for me to take the time to research and develop a more detailed and complete answer. What a team we are.

And a big thank you to those that come to the group asking a question or requesting help. I've learned more about my UV-5R by trying to help you all than I could have ever learned by just using it. Thanks you you I am still learning its secrets.

And in closing, thank you to all that have commented on Ian's post. I've always thought I've gotten my moneys worth out of my LCR. Today it became priceless.

J-Poles are great and you can make them out of just about anything. You
can also make a dual band one.

And, they have gain, unlike a 1/4 wave.

Steve asked:

> I just do not seem to understand what the procedure
> is to get frequencies on channels 000 to 127.

I am only guessing that you have tried to manually enter a frequency into memory channel 000 and have not been successful.

If there is already something stored in memory 000, you must first DELETE that channel, using Menu 28.

Then you can enter the frequency that you wish.

IF MY GUESS IS WRONG, then stand by, an answer will be forthcoming from another list member.

Topic: 8036 Message: 8074

I want to use excel and use the csv import/export, because I am a screen reader user, IE, blind, and the chirp, and bf software are very inaccessible when using a screen reader.
About the most I can accomplish within chirp is upload/download from radio, selecting vendor and model for reading/writing purposes, and I can read some of the columns, but I cannot actually edit them.
I can also read the other menus for save and import/export.
Excel is very accessible with JFW or JAWS for windows which is the screen reading software I use.
So with the template, I can now create my own freq lists in excel, and import the csv file into chirp and upload it to the radio. It's about the only work around for using software to program the uv5R for someone using a piece of screen reading software at this point.
So, any columns that are not exported or imported using a csv file, will remain in their default state because i can't change them before uploading to the radio.

So true, Mike!

I tried this just for grins. I used two Baofengs, a couple cables, and the VOX setting to try to make a crossband repeater. Aside from the horrible audio (which probably needed some volume tweaking), the desense was absolutely terrible at 6'.

It was a fun experiment, but not productive.

Cheers,
-Brad

Colin,

I believe that Power and Cross Mode are the only columns on the CHIRP spreadsheet view for the UV-5R that don't get exported to a CSV file. I don't see Cross Mode being nearly as useful as Power would be.

In the mean time, if you would add the Power column to a your spreadsheet and email it to me, I could probably find the time to import it into CHIRP, edit the power settings and return an .img file to you.

Thanks. I learned something.

I originally provided my new UV-5R menu reference as a spreadsheet. But I use an excel compatible software and not everyone was having the format display the same way. Because of this I decided to 'print' it to a PDF file. Are you able to work with PDF files?

HOWDY FROM TEXAS!!!
I just want to say howdy and say that I am a VERY NEW person to HAM and plan on getting my license asap , and I am shopping around for radios and think I have settled on the baofeng uv-5r PLUS , I just ran into it a few minutes ago and it seems pretty nice , an upgraded uv-5r.
I am gonna take others advice and buy from a u.s. dist. and get the programming cable along with it , but plan to get some accessories from the 409shop. like the 4000mah battery and maybe the throat mic's.
anyway , just wanted to say hi , and Im sure I will be learning quite a bit from all you guys.
Gary

unless you can get quite a bit of distance (say 100 feet) between the rx and tx antennas, you will need band pass, and band pass/band reject filters/cans on there.
the band reject allows you to tune a specific frequency to notch out...say on the rx side, you can notch out the tx frequency, and on the tx side, you can notch out the rx frequency so that it gives a far tighter filter at that particular frequency to help reduce desence on the rx.
this is especially true when you are using a single antenna for rx and tx.
you can build your own filters out of coax stubs, lots of plans on the net for such things.
not as effective as cans, but might get you into the ball park.
If you want to build a cross band repeater, simply use a common VHF/UHF diplexer with a single dual band antenna to help prevent desence.
For a run of the mill VHF ham repeater with a 600K split, the rule of thumb, is a minimum of one BP and one BPBJ can for both tx and rx...so four cans in totle. And that's pretty much the minimum you can get away with. Many have at least 3 cans on each side, sometimes more.
Bear in mind this is typically for relatively high power, IE 20W or more tx power too. So with lower power, like on the UV5R, of perhaps 4 to 5 watts, you don't need nearly as much filtering. SO that is why I suggested looking into the tuned coaxial stub filter idea.

as long as the PDF is not a scanned image, I can work with it.
IE, if you take a regular txt document like a doc or dox or excel
spreadsheet or whatever else, and save it as a PDF, it'll work fine.
If you scan a document in and save it as a PDF, it won't work with JFW
without using some kind of OCR, Optical character recognition, software.
and even then, it's flaky.
I'll check out the menu list pdf in the files area of the group and let you
know if it works.

ok, thanks Jim.
that begs another question, can one edit the .img file somehow?
or is it similar to the .dat files created by the BF software where you
pretty much have to understand programming language to edit it?

Topic: 8036 Message: 8086

Colin,
I have messed around a little bit in a CHIRP .img file with a HEX editor. Things like the Alpha Tags are easily recognizable and editable. Other things like the Power-on Message and the [6] key Power-on Message are easily found and edited. I did save to .img file where the only difference was a particular channel was set to high on one and low on the other. I did find the exact byte that was changed in each file and was able to change high power to low power with the HEX editor. I wouldn't feel comfortable messing around too much beyond this though.

After having problems with the stock antenna kicking the transmitter off due to high swr I changed to an little dual band reverse SMA antenna I had that is made by Jetstream. Works GREAT! No more shutdowns on high power. I had to trim the thread length down with my Dremel tool but it fits perfect and works fine.

Shouldn't the antenna the unit comes with work properly with the radio?

The UV5r uses a FEMALE SMA antenna. REVERSE SMA is a completely different connector.

8091. Question on changing power levels in channel mode

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-16 00:01:39 UTC
From: Chris Ruhl
Topic: 8091 Message: 8091

I don't know if this has been addressed but . . .

I read on page 13 of the manual (center of page, text in grayed box) that certain menu options are invalid in channel mode but the manual specifically mentions that "Only H/L power could be changed."

I have attempted to change power level of a particular channel in the menu mode following the instructions and it doesn't appear to work. No "L" appears on the screen. It does when I change the setting but disappears when I exit. I have no problem when in VFO mode.

Am I doing something wrong, or really am transmitting low power even though the "L" doesn't show, or is the manual incorrect or I'm reading it incorrectly, or my unit's firmware not correct?

For now, I have two channel entries for the same repeater, one for low power and one for high but it would be nice to be able to change it to "low" when I'm close to the repeater and save battery life and keep it at "high" when I'm far and need higher power.

Thanks, much!
Chris

8093. Re: Question on changing power levels in channel mode

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-16 00:20:53 UTC
From: Jim
Topic: 8091 Message: 8093

This tip is correct, but note that it only works if menu 7 (TDR) is set to off. It is also just temporary. As soon as you change channels, access a menu or press the [A/B] button, the power lever returns to the level that is programmed into the currently active channel.

i don't think you can change the power level from the menu while in channel mode. try hitting the # key at bottom right in channel mode and i think that toggles it on a temporary basis. i don't have the radio with me or i'd double-check that for you.

try here:
http://webcache.googleusercontent.com/search?q=cache:Lt896NOhbD0J:handiham.org/manuals/Baofeng/Baofeng-UV5R-eyes-free.rtf+&cd=1&hl=en&ct=clnk&gl=us
under

Thanks.
So do you think I may need a new cable? Driver?
Where it says "Port" there is nothing for the HT. There are two Bluetooth listing and three other listings from another serial to usb driver that is being used by another past cable.
What do you use or what should be there?
thanks

I've searched the group without any luck, so before I spend some money I thought I'd ask if every earpiece gives you that same loud CLUNK sound as the one that came with the radio.

Also, just curious, are there any of these cheap radios (sub 200) that also has wide receive (not tx, just rx) that covers 800mhz or VHF-Lo?

Thanks

Repeater Controler $75
Cables to Radios (2) $13
Cables to Duplexer (1pr) $13
Duplexer $85

Your cost excluding (2) UV-5rs, antenna, mast & cable: $186

After you figure in the UV-5rs @$50, antenna for $20 you are up to $306.

A remaining item is power generation and an enclosure for all the stuff. Maybe $400 total, should do the trick for emergency and or short term work at least.

yep, get this:
http://www.radioshop888.com/radioshop_product.php?id=104068
and this:
http://www.radioshop888.com/radioshop_product.php?id=104039
and you'll be in repeater heaven...stick a PA on the transmitter because the duplexer can handle 30W.
Funny, I've never seen VHF/UHF amplifiers sold by these chinese vendors...wonder why.

yep.
though I'm not sure this means that it will only work with an 8MHZ split or greater, or if it means the opposite as is so often the case with translations.
Seems pretty silly to make a duplexer which doesn't work with anything less than an 8MHZ split...since there aren't too many repeaters built with a split even that large.
Even commercial stuff rarely exceeds 5MHZ on VHF.

Sadly, it won't work. It is a mobile duplexor for commercial radio. Hence
the 8Mhz minimum split. You might get it to work if you bought 2 of them
and used 1 to reject 1 frequency and the other to reject the other.

I am going to have to think about this and how to plumb it.

I thought of this a year ago and asked on rec.radio.amateur.antenna about it. There was a long discussion, but it can be summarized as "it won't work".

Note that some of these cheap duplexers can be set for 3.5 mHz for VHF, which is enough for the US 2m band if you don't mind being careful not to step on weak signal operators, but not enough for hams with 144-146mHz 2m bands.

The UHF ones can be had in 5mHz split, which will accommodate the 70cm ham band, GMRS (in the US), but AFAIK not FRS, PMR446, or the Australian CB band.

Note that they are not very good, and if you plan to run 25 watts or 50 watts, expect them to desense the receiver enough to make it only a local (it is a mobile duplexer after all) repeater.

One watt or five watts is more like it.

I question the wisdom of using a new UV-5R as a repeater because of the availability of old LMR/PMR rigs these days. In the US, there is a glut of wideband (and a lot more coming in January) rigs, and even here in Israel, I have been able to get beat up, but working 100% Motorola rigs for about the price of a case of cheap beer, including postage.

I'm sure there are if you look around a lot of cheap older rigs that would run a 100% duty cycle for days without a problem at 1 watt or even 5 watts, and they probably cost less than or about the same as a UV-5R.

A friend of mine bought used Tait mobiles for $75 each from the US from a dealer, with a warranty, and I was offered 2 channel Maxtracs for $13 each, if I could figure out how to get them here.

A ham here made a suitcase repeater using a mobile duplexer and 2 HT's. One was a Motorola HT600, the other I did not recognize. He's posted photos to local groups, I'll ask if I can post a link here.

It may not be exactly what you asked, but it will give you an idea of what has to be done.

I expect that if you did use UV-5Rs to make, it could be about 1/2 or less the size.

BTW, Radio Shack used to sell a 20 watt amp that matched the HTX202. It had a really tight front end preamp in it that made the '202 almost intermod proof. If you could find one that no longer amplifies the output, but the preamp still works, it would (at least on VHF) tighten up the front end of the UV-5R, for very little money. You could put it on the receive side.

Geoff.

Well familiar. I've built several J-poles, all work fine. But I can't carry them around on the HT. ;-)

Also have the roll up Slim Jim from N9TAX (2 Way Electronics). You just can't make one for this price.

http://www.hamuniverse.com/n9taxslimjimreview.html (review)

I am new to the group and my head is spinning! I bought the BaoFeng UV-5R thinking it would be easy to use. WOW was I wrong, there is so much to learn about programing and using this radio. But now that I found this group, and with the help of all it's members. I stand a chance of being able to use this radio. Are there any members near Rochester NY. Book learning has never been my strong point, more of a hands on learner. So if you are close to me and know what you are doing with this radio, please send me an email. But for now, I will look into finding a class near me to get my ham license. Thanks, Sean

Here's a link for one from 409shop that is a 5Mhz min.:

http://www.409shop.com/409shop_product.php?id=104460

It's a 50w duplexer, but they have smaller sizes too.

when you get very close to the edges of your duplexers freq range, the
filtering of course becomes far less efficient.
so even on this one, using a 5 meg split won't give you the tight filter
that a wider range would.
That's why we still need to use filter cans to get that .6MHZ split and
enough attenuation to keep desence from occuring.
Of course you can use reslocks, which is what these are I believe.
But the VHF and UHF reslocks I've had the fortune of coming across all allow
for a very narrow split, IE, 500K or even a bit less...so well within the
range for a 600K VHF amateur offset.
You could probably squeak by on UHF with this 5MHZ unit though if you had
too...but I wouldn't want to run anything beyond 5W on tx with it.
There are so many bottle type VHF and UHF duplexers out there for the taking
right now that it doesn't make a whole lot of sence to try and get this 85
dollar unit to perform on ham offsets.

it's really not terribly complicated once you get the hang of it.
Once you begin to understand how repeaters work and so on, it'll make much
more sence.
It's not much different than programming your cell phone, or what one used
to have to do to program a VCR...or satellite box or whatever else.
There are only a few steps to program it, and as long as you stick to those
steps, it works flawlessly everytime.

I thought I saw someone on here make a crossband repeater with a couple of these radios once. Maybe it was another brand of inexpensive chinese radios. Having the input on 2m and output on 440 would remove the duplexor from the equation. Get one of those $70 controllers, or make one and you'd have an inexpensive option. People who have only 2m or only 440 capability couldn't use it though.

I get one thing working and hit a block on the next.

1. Why is there an "s" on the display to the far left of my ofset which is a "+" for what I want to do, and what can I do? Tried to do default but keep getting "Cancel". I have done that before and then restored to English. Seriously, I'm beginning to think this radio is too much for me enen though I was able to set up many radios in the past.

Could we start with the "S" thing and if not, please remind me of the steps for successful factory default. I can get English back with Menu 14.

Bob asked:

> 1. Why is there an "s" on the display to the far left of my ofset which
> is a "+" for what I want to do, and what can I do?

According to page 10 of the so-called "manual," the "S" indicates "Dual Watch/Dual Reception functions activated."

I do not get a little "S" because I operate my radio with Menu 7 - TDR in the OFF position. This makes the radio receives only on the band I have selected, either A or B, and I nearly always select band A.

If you want the radio to scan back and forth between A and B, then TDR should be ON. The "S" will be displayed.

If you want the radio to NOT scan back and forth between A and B, then TDR should be OFF. The "S" will not be displayed.

Does that make sense? If so, next question.

Yep, I use this one for a 440 portable repeater. The cavities are more effective at this frequency than the same size on 146 MHz. It works just fine but you have to keep in mind that it is a mobile duplexer which is a notch only design. It does not have any off frequency rejection for the receiver. All it does is block the transmitter signal from the receiver.

Don't let all the griping about the difficulty of programming fool you. Yes, it is difficult, and yes, the manual is very lacking. There are Youtube videos that demonstrate how to program manually, and for the most part, they are OK. Programming via computer, especially CHIRP, is much easier.

But I've had to program other radios. WITH a manual, it took me HOURS to program just 10 channels for 2m in my (long ago sold) Yaesu FT-897. Also, I was asked to program a friends Yaesu HT, and even with a much better manual than the Baofeng, it was still very confusing to program. So it's not just Baofeng.

Now, to finding a class and exam location near you.

Look in the Files section here and read "For the Wannabe or New Ham".

Thanks to all for the replies! Very helpful and yes, the # key works well and it stays at whichever setting so long as I don't move off of that channel -- I can go to VFO and back and again and it stays put.

That # key option is very useful as the radio does get hot if on high power too long and most of the time I don't need more than 1W

I purchased a Diamond RH701 antenna which works considerably better than the stock one. I had the stock antenna in place and could not hear "NOAA" weather from where I was, but I screwed in the RH701 and it suddently came to life!

My only modification was a 5/16" tooth lockwasher to act as a spacer for the little space between the antenna and case. Perhaps not needed but less chance of dirt building up in there. I have some 502.xxx Mhz channels programmed in and I get much better receive with the Diamond as well.

bob, turn menu 17 to zero.
press menu, 1 7, menu, 0, menu.
it will say confirm.
As I've said a couple times now, you should have your dual stand by off and the primary band set to zero...read the document, it's all in there.
If you get cancel when you try to enter a frequency, it means the radio is on the wrong band, simply press the band button once and you can enter that frequency.
the band button is the right one just above the main keypad.
don't give up yet, you just have to stick with it, get the menu settings correct and then you'll be laughing.
it's no more difficult to program than any other ham rig, you just have to disable a few anoying features before you can program with ease.
the eyes free document tells you which menu settings to turn off to make things easier.

Date: 2012-09-16 21:00:20 UTC
From: Bob Martin
Topic: 8131 Message: 8131

I think the "S" to the left of the "+" noted earlier is for squelch but there are enough additional problems that I want to start from scratch. Among other things, the VHF band is showing up in both display fields. When I use the Band and/or A/B and finally get the radio to accept Menu 40,and hear something I don't understand, I hit Menu again then (1) then Menu, I hear cancel. A couple of times, I have gotten it to reset, then used Menu 14 to get back into English and start over. Doing things over until one has them mastered is good but I have to get back to Reset to do that..

If I don't get my act in order, I think I should sell the radio so I can leave you folks alone.

> At my age I'm a newbie to any thing. I really would like to be able to
> communicate with my group. Any suggestions is most appreciated.

First it is important to understand the difference between simplex and duplex. If you push the * key momentarily, you will probably see the frequency 467.6875 displayed. This channel memory has been set up for a repeater with a PLUS 5 MegaHertz OFFSET. This means that the radio transmits on 467.6875 and receives on 462.6875 MHz.

They are telling you that you do not want to have an offset, you must transmit and receive on 462.6875 MHz, which means simplex.

Did you program that frequency into this radio in the first place? If yes, then you could choose another empty channel and put 462.6875 in that memory channel with Menu 25 - SFT-D OFF. Store that frequency in that new channel memory. Then, when you push the * key momentarily, the frequency display will stay on 462.6875 MHz.

If you did not program that frequency into this radio, you will have to start at the beginning or get some help.

Does this make sense so far?

That sounds pretty good having a duplexer and in a way it would be better to have 1 just incase and on that 409shop website they have 15W UHF(430MHz-450MHz) Linear'sfor $80US and 20W VHF Linear's for $80US aswell,if I had $200 I would have some fun with a 50W duplexer and a 15W UHF Linear and that hooked up to a 4.5db Antenna would give me a pretty good distance,but then when it comes down to it there would be a RX amp needed of some sort

Btw I was just thinking a UV-5R with a speaker mic in someones car with a UHF Linear would be a pretty cheap mobile unit with ALOT more coverage and or a VHF Linear would be useful and having a dual band antenna or a antenna switch and or a 2 antenna setup

I set up the frequency of 462.6875 on A and Channel on B. s
Settings are at 462.68750, Tone mode None,88.5, 88.5,DTC code 023,DCS pol NN,
Cross tone is set to TONE>TONE, Duplex None, OffSet,0.000000,MODE FM,
Power HIGH. Im using chirp. The nextfrequency was set at the same frequency in the next

channel

I had the same issue. I found that the pins on the cable do not align with the contacts inside the radio. I put a sideways pressure on the cable end with my thumb and the pins made contact. Let us know if it works. N8xk

Please excuse earlier postings today. I kept on keeping on until I worked through problems without understanding how I did some of them but did do them. If you followed the thread, the "S" went away after I finally had a successful reset to factory default. Still don't know why that setting, factory default, didn't work with many tries but did finally. I think I did the same thing each time, that is, selected Menu 40, heard a voice I didn't understand, hit menu, pressed "1", hit menu then Exited.

I have now reentered all of the memories I had written.

Thanks, Everyone, and especially Scott, KB3JQQ.

paul's spot on the money. just think, you could have paid nearly $500 for a yaesu vx-7/8r, read the yaesu manual six times forward and backward, and _still_ have to hire someone to program it for you!

steve: the best thing i can recommend at this point is for you to go to this link:

http://buddy.brannan.name/baofeng-uv5r-eyes-free.rtf

and read through that file step by step.

even though the procedures to work with frequencies and channels are somewhat different with this and other of the new crop of chinese radios, i find them (the procedures) no harder than working with uniden scanners or yaesu/icon/kenwood radios--just different. yes, there are some things missing such as being able to copy a channel to a vfo, but in return you actually get simpler operation, believe it or not!'

good luck,

/guy (73 de kg5vt)

I tried this and yes i can change it and drop to the Freq range to start at 78.0000

However it does not work on test? Has anyone actually tested it? I may have it all wrong so i will ask another question. If i may

I want to program freq to TX and RX the information i have is frequency 79.8750 and CTCSS is 118.8PL
Can you please tell me how to set this up on the radio itself if i use CHIRP it errors out due to the range
However on download of the radio i can see the settings in CHRIP

I have managed to program it but it does not work on my test unit i don't here nor transmit to the test radio (however it appears as normal use on the uv5r.)
The test radio is a working fine with other units

I think i may have a setting wrong on the tone option as i don't understand it fully.

Thanks for your help

8144. Simplex frequencies:

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-17 00:25:21 UTC
From: Mike Barnard
Topic: 7024 Message: 8144

I just got my radio, and for me I programed the frequency, in vfo mode, then menu 27, then channel number, it said receive memory, and then the same thing and it said transmit memory. I didn't use the off set, for me it was easier to just program receive and transmit frequencies. A little more work but I am blind, and it seemed easier this way. I was able to program 146.520, as simplex.
KD2CDU.

Mike,

That's great. When I started out I used the programming cable and software because I thought using the keypad was too hard. Then I decided that I needed to learn the keypad method anyway because it would be difficult to help others do it if I didn't experience it for myself. Sounds like you got the hang of it quicker than I did! My hat is off to you my friend.

The UV-5R ignores shift and offset when programming channels. They are not needed, as you already know, because you first enter and store the RX frequency and then enter and store the TX frequency.

Here's a tip: You only need to enter and store the TX frequency when it is different from the receive frequency. Otherwise the TX frequency is assumed to be the same as the RX frequency. Saves a couple of steps and quite a few key presses.

Jan,
Channels cannot be edited. So you have to delete it and then create it again in frequency mode.

Select the upper display
Select frequency mode
Select the UHF band

key in
[A/B] : select the upper display
[VFO/MR] ; select frequency mode
[BAND] ; select the UHF band
[MENU][2][8][MENU][0][0][6][MENU][EXIT] ; deletes channel 6
[MENU][1][MENU][0][MENU][EXIT] ; sets 2.5KHz step
[4][6][2][6][8][7][▲] ; set frequency to 462.6875
; you should check to make sure menu 10, 11, 12 & 13 are OFF
[MENU][2][7][MENU][0][0][6][MENU][EXIT] ; save in channel 6

Done

Good luck,
Jim KC9HI

Topic: 8126 Message: 8150

In the U.S, 462.6875 is FRS & GMRS (shared) channel 6.

Using a 'commercial' or 'ham' radio (such as the UV-5R) on this FRS channel in the U.S. is a violation of FCC Rules because the radio is not certified by the FCC for FRS use (power greater that 0.5 W and removable / replaceable antenna). If you have an FCC license for GMRS (which currently costs $85 and covers the licensees immediate family), the UV-5R might be legal. In the U.S., you need an amateur (ham) license to transmit with the UV-5R in the ham frequencies and/or an appropriate commercial / business or perhaps GMRS license to transmit on other frequencies.

Hi,

What is the recommendation outdoor (not mobile antenna that attach to a car) antenna for UV-5R?
Let's start with the cheapest one.

Quicket, cheapest and easiest to install is the flexible Jpole from W9TAX.com. The VHF/UHF version is around $26 and I can tell you it works super.

Otherwise you can build them yourself, not hard and rewarding.

You will need adapters at the UV-5R end. I suggest that you gravitate toward BNC, that way you can easily put a small mag on your car and use it there also.

You will get many responses..... Welcome.

Adam,
All you can do with CHIRP is to tell your UV-5R to accept frequencies lower than 136.000 MHz with is the lowest that CHIRP will program.

So what you do in CHIRP is go to Settings | Other Settings and then set VHF Lower Limit MHz) to something lower than what you need. In your case, set it to 78. Then upload the changes to your UV-5R. CHIRP will still be limited to 136-174 MHz but the UV-5R won't.

Now disconnect your UV-5R from the computer, enter frequency mode, switch to the VHF band and enter the desired frequency. However in my testing the other day, I believe that the first digit had to be a 1 so as far as I know 100.000 MHz will be as low as you can enter with the keypad.

All I know is that I could enter frequencies lower than 136 MHz. I never tried to save any of the lower frequencies to channels. I never tried to transmit on any of them (no antenna, no license, no desire to tear up my UV-5R).

Good luck,
Jim KC9HI

If you're in the Baltimore/Washington DC area, look for a test
session from the Laurel VEC. They never charge a fee for testing.
They will be at the CARAFEST in October on the 7th. You have to
pay to enter the hamfest, but there is no charge for the test.
There are other locations they test at where there is no "cover". :)

You can't change the receive memory once it's set, but you can rewrite the transmit memory. I set my test memory up for KC3FI and had a CT when I checked with the # key, so I turned menu 13 off, typed my xmit freq again, went through menu 27 again and it saved a new transmit memory without a tone (no tone for that repeater, yet).

wow, a little pricy for a 15 or 20W amplifier.
You can buy them all day long from QTH.net, eham.net and ebay of course from sellers of ham gear for allot less than that.
You can also buy dual band amplifiers, which are more expensive, but preclude the need for two antennas and a diplexer etc.

Scott,

Your are absolutely right. I just converted a repeater channel to a simplex channel and then back to a repeater channel. Thanks for taking the time to point that out.

So for most changes to a channel, the channel must be deleted. Not so for adjustments to the TX frequency.

oh, and by the time you buy all that stuff, you could probably buy the
anytone AT588UV dual band mobile that is now on the market...though not yet
on ebay from what I can tell, for cheaper.
acording to the info I saw on alibaba.com, the factory price is $120 to
$140, but you have to buy a lot of 10.
has anyone pulled the trigger on any of those yet?

Topic: 8139 Message: 8164

hey bob:
one more thing.
turn off menu 7, 33, and 34.
these all have to do with the dual watch/dual stand by and how the radio deals with which display it uses at what time.
Turn off those three menus by simply pressing menu, then the corresponding number of the menu, then menu again, then press 0 to set it to off, then press menu one more time and you should hear confirm.
This will eliminate much of the visual confusion that you have been experiencing.
So, to turn off menu seven, which is the dual watch mode, press the menu key, then the number seven, then menu again, then the 0 key, and menu again to confirm.
Press the exit button, which is the top right button next to the down arrow key to exit the menus.
So, for menu 33, just press menu, then 3 3 and menu again, then 0, and menu.
Pressing 0 will set the menu to off in each one of these examples.
turning these three menus off will keep the S out of the display, and prevent the radio from trying to flip back and forth between your two displays while you are trying to use it.

Please excuse earlier postings today. I kept on keeping on until I worked through problems without understanding how I did some of them but did do them. If you followed the thread, the "S" went away after I finally had a successful reset to factory default. Still don't know why that setting, factory default, didn't work with many tries but did finally. I think I did the same thing each time, that is, selected Menu 40, heard a voice I didn't understand, hit menu, pressed "1", hit menu then Exited.

I have now reentered all of the memories I had written.

Thanks, Everyone, and especially Scott, KB3JQQ.

Thanks, Colin:
I already had menu 7 set to 0.
Was able to get Menu 33 to 0.
Could not set Menu 34. Just got beep after pressing Menu then 34. Hadn't changed anything since had just successfully set 33 but checked to see anyway. Wonder what that "s" stood for and how it got there today. Actually I am learning and getting better with your help and that of others but do have a strange thing on the display. When I got the radio and after a couple of resets to default, the display shows UHF frequencies in both fields, one of which I wrote in one of my failed attempts to program a repeater. Doesn't seem to inhibit the several repeaters I set successfully.

Earlier, neither the FM receiver nor flashlight would work but after I pressed the button for FM several times, they work fine. My wife and I have been attempting to figure the value for having the alarm. I suggested that it would probably scare away an attacker!

Thanks. I hope I can cut way back on postings, many of which I figured out after relaxing. Wanda says "Go take a Valeum."

Subject: Re: [baofeng_uv5r] All Is Well

hey bob:
one more thing.
turn off menu 7, 33, and 34.
these all have to do with the dual watch/dual stand by and how the radio deals with which display it uses at what time.
Turn off those three menus by simply pressing menu, then the corresponding number of the menu, then menu again, then press 0 to set it to off, then press menu one more time and you should hear confirm.
This will eliminate much of the visual confusion that you have been experiencing.
So, to turn off menu seven, which is the dual watch mode, press the menu key, then the number seven, then menu again, then the 0 key, and menu again to confirm.
Press the exit button, which is the top right button next to the down arrow key to exit the menus.
So, for menu 33, just press menu, then 3 3 and menu again, then 0, and menu.
Pressing 0 will set the menu to off in each one of these examples.

turning these three menus off will keep the S out of the display, and prevent the radio from trying to flip back and forth between your two displays while you are trying to use it.

Subject: [baofeng_uv5r] All Is Well

Please excuse earlier postings today. I kept on keeping on until I worked through problems without understanding how I did some of them but did do them. If you followed the thread, the "S" went away after I finally had a successful reset to factory default. Still don't know why that setting, factory default, didn't work with many tries but did finally. I think I did the same thing each time, that is, selected Menu 40, heard a voice I didn't understand, hit menu, pressed "1", hit menu then Exited.

I have now reentered all of the memories I had written.

Thanks, Everyone, and especially Scott, KB3JQQ.

bob:
yes, menu 34 probably becomes inhibited once you have turned menu 33 and menu 7 off.
The S stands for stand by mode, so if the radio is set to dual watch or dual stand by, that S will appear.
Once you have menu 7 set to off, that S disappears.
The radio defaults to dual stand by mode when you do a full reset...so if you do a full reset, the S will come back.
Just remember, if you do a full reset, you have to remember to turn menu 7 and 33 off again or you'll run into the same issues.
hope you can start having fun with the radio now that you have a few things figured out.

Thanks, Colin:
I already had menu 7 set to 0.
Was able to get Menu 33 to 0.
Could not set Menu 34. Just got beep after pressing Menu then 34. Hadn't changed anything since had just successfully set 33 but checked to see anyway. Wonder what that "s" stood for and how it got there today. Actually I am learning and getting better with your help and that of others but do have a strange thing on the display. When I got the radio and after a couple of resets to default, the display shows UHF frequencies in both fields, one of which I wrote in one of my failed attempts to program a repeater. Doesn't seem to inhibit the several repeaters I set successfully.

Earlier, neither the FM receiver nor flashlight would work but after I pressed the button for FM several times, they work fine. My wife and I have been attempting to figure the value for having the alarm. I suggested that it would probably scare away an attacker!

Thanks. I hope I can cut way back on postings, many of which I figured out after relaxing. Wanda says "Go take a Valeum."

I have been a certified Tech Since 1980 but this Has me stumped.
At the mic jack on the Uv5r There is a voltage applied to pin 3, which is a normally closed connection to pin 4 but what I don't understand is that there is no connection at all to pin 4, it seems to do nothing. Lastly even if you were to stick a mic in this jack pin 4 it would still do nothing as it shows no connection. Can a better Tech check this out and see what I am missing, Thanks

From: John Kolb
Topic: 8172 Message: 8172

Using chirp, I set the lower freq limit to 88 MHz, wanting to try to receive bcst FM stations, and from the keyboard, set a channel to 104.9 MHz. Yes, I know that FM Wide in the UV-5R is 5 kHz and bcst FM is 75 kHz deviation, but I expected to hear something. Instead, I heard nothing. I conclude from this that the front end bandpass filter for the VHF range starts rolling off shortly below 136 MHz, and isn't going to allow reception of any but the strongest signals below this point. Something with a signal generator handy might try to verify this.

The lowest keyboard freq that can be entered is 100 MHz (after modifying the standard 136 MHz limit). Zero is not permitted for the first digit. However the freq can be started at 100.000 MHz and walked down with the down arrow key to lower freqs.

John
KK6IL

At 07:18 PM 9/16/2012, you wrote:

Adam,
All you can do with CHIRP is to tell your UV-5R to accept frequencies lower than 136.000 MHz with is the lowest that CHIRP will program.

So what you do in CHIRP is go to Settings | Other Settings and then set VHF Lower Limit MHz) to something lower than what you need. In your case, set it to 78. Then upload the changes to your UV-5R. CHIRP will still be limited to 136-174 MHz but the UV-5R won't.

Now disconnect your UV-5R from the computer, enter frequency mode, switch to the VHF band and enter the desired frequency. However in my testing the other day, I believe that the first digit had to be a 1 so as far as I know 100.000 MHz will be as low as you can enter with the keypad.

All I know is that I could enter frequencies lower than 136 MHz. I never tried to save any of the lower frequencies to channels. I never tried to transmit on any of them (no antenna, no license, no desire to tear up my UV-5R).

Good luck,
Jim KC9HI

You need to wait for a quiet portion. Once the deviation is
beyond what it's designed for, it turns to white noise, except
in the real quiet portions. My FM modulator makes spurs that
stop my scanner between songs. Goes away when the music starts.

My guess is that the Kenwood spec calls for powering some accessory from the HT.

When the Baofeng engineers borrowed the design, they got it wrong (power should have gone to pin 4 instead, or even pin 3 and pin 4 would work).

Since us Baofeng owners have most likely never plugged in one of these HT powered accessories, the mistake has never been noticed.

Another possibility is that the schematic is wrong. When I start working on building my programming cable I will try to remember to measure and see if there is 3.3 volts on the tip of the plug.

Google "kennwood 2-pin speaker mic schematic" and the first image shows 5v in the device properly attached to the socket providing voltage to the tip of the plug.

AFAIK, the 5v line is for the active mic and dtmf generator is some of
the HT handsets.

I'll have to dig up some specs, but I'm pretty sure it SHOULD be either
on the TIP of a 3 conductor 3.5 plug. (aka pin3) the 4-condutor 3.5 plug
is NOT kenwood HT spec.

Could this be something to do with charging or powering the radio through the speaker/mic jacks? I've seen pictures of a battery eliminator or charger that has a 12V cigar lighter plug at one end and a Kenwood speaker/mic jack at the other. I was hoping someone would get one and work out the connections so I could make my own external charger lead.

You need to wait for a quiet portion. Once the deviation is

beyond what it's designed for, it turns to white noise, except

in the real quiet portions. My FM modulator makes spurs that

stop my scanner between songs. Goes away when the music starts.

I'm told that J-Poles are good and cheap, as are Slim Jims (I think one was developed from the other - I'm not sure which way round!) but are there any hand-build suppliers similar to Ed working in the UK? The cost from Ed is cheap, but when you add on US Overseas Airmail, it is more than doubled... :(

I'd like to have a go at building my own, but I want one I know works first!

Martyn

I would try building your own first. They do work. Trust those around you.

More importantly, the physics works. You should be able to build one that
will work just as well for the price of a pint. :)

J-Poles/Slim Jims are half wave antennas. The first 1/4 wave is a matching network. They need to be on top of the support pole and have to be a few wavelengths from any surrounding metal. They are greatly affected by their surroundings. You may want to try to make a 1/4 wave ground plane. If you look at it, it's just a variation of a 1/2 wave dipole, just that one side is made into a groundplane rather then the equal & opposite end of a dipole. The groundplane decouples the RF from flowing down the shield and also helps to isolate the antenna from it's surroundings.

Martyn,

It would not hurt for you to contact either N9TAX.com or Ed out there in California and see if either would share/sell the design to you. The designs are quite simple except for the tuning that is done in the final work.

Since neither will probably send you all of their secrets perhaps you can get together with a few buddies and order multiple units in order to split the shipping costs. The least that I can see it costing for one unit is $16.95 (small box 4# limit) and I think you can get two or three in the box if you don't order the 16ft cables to go with them. Again I would check with N9TAX for those options. Perhaps your local Ham store would consider stocking them.
 Good luck,

JL

Hmmm: Maybe it is time to put together a "cheap" antenna list. I wish I had time. It would be great for the New Hams. I have considered writing a paper on antenna basics but I am sure it has been done already. My thoughts are to make it for the newer Hams to aid in understanding the importance of SWR etc...

I have 2 of the N9TAX dual band "Slim Jims" I also have the "HT Saver" he sells. Great service and a superb antenna for the price

Hi Martyn..

The j-pole is an end fed half wave antenna, normally made from copper pipe or aluminim rods. The "slim jim" is a j-pole made from tv antenna twin lead; it can be rolled up and is very portable. Electrically, the antennas are identical.

Both of these antennas are fairly easy to make at home; there are many plans on the internet. The cheapest would probably be the slim jim, but it would need to be protected from the elements if mounted outside.

Probably the connections are wrong in the schematic, pin 1 and 2 should be reversed as well as 3 and 4. The same goes for the speaker connector, those are mixed as well.

Hi:

Last night, I was able to put 5 local repeaters into memory but not able to do a couple more today. Here is what is happening. The display shows 2 meter frequencies in both fields, one is a frequency I had done earlier and radio will allow me to change it. The bottom field shows another 2 meter frequency, not the 440 default which was there until today.

No matter what combination of A/B and BAND I use, radio allows entry of receive frequency channel, confirms with "receive frequency" and allows Exit. I enter the transmit frequency, open Menu 27, hear prompt for channel, enter the same number but when I hit Memory, instead of hearing "Transmit Frequency" I just hear the word "menu".

Please tell me, short of resetting to factory default, how to clear up the display problem and why I can't hear "transmit frequency" instead of "menu" so I can exit.

A week from now, you probably won't see thews newby questions posted.

73 and thanks!
Bob Martin

Make sure both menus 21 & 22 are set for FREQ. It will default to showing the first frequency entered if you have these menus set to NAME and you program from the keypad.

I bought 2 Slim Jims from N9TAX on eBay, and Joe was willing to combine shipping and send them by a slower pigeon since I was more interested in economy than speed. These antennae are great performers and excellent value.
I also bought some 450 Ohm ladder line on eBay from another vendor, and made another one myself for fun based on the design. (I had the miscellaneous parts in my junk inventory already.) That one is hanging in my garage and the coax terminates at my computer for the UV-5R. Works great.

I'm told that J-Poles are good and cheap, as are Slim Jims (I think one was developed from the other - I'm not sure which way round!) but are there any hand-build suppliers similar to Ed working in the UK? The cost from Ed is cheap, but when you add on US Overseas Airmail, it is more than doubled... :(

I'd like to have a go at building my own, but I want one I know works first!

Regards, Martyn M3MDY

I see it a bit differently Jimmie. There are many 300 Ohm TV twin lead or 450 Ohm ladder line plans that also call themselves "J-Poles". The difference, I think, is if the conductors are joined at the top, (making use of the dormant upper section of the stub side to form a folded half-wave with the active side), it is then referred to as a Slim Jim. You can't really make a Slim Jim out of copper pipe or the like, as you say, so the "hard" antennae are all J-Poles, but the roll-up variety can be either. I could be wrong.

Hi Martyn..

The j-pole is an end fed half wave antenna, normally made from copper pipe or aluminim rods. The "slim jim" is a j-pole made from tv antenna twin lead; it can be rolled up and is very portable. Electrically, the antennas are identical.

Both of these antennas are fairly easy to make at home; there are many plans on the internet. The cheapest would probably be the slim jim, but it would need to be protected from the elements if mounted outside.

I think your observation is headed in the right direction and it looks like info on the internet confirms it as well. I have built both antennas with material other than twin lead/ladder line so the definition may extend to "hard" material for both. In any case, either does wonders for the HT. As some may have noted, Ed's dual band antenna has been in a couple of publications in the last few years (QST) and can be found on the internet.

Hey all on the group,

what is the latest firmware version for the UV5R and is the UV5rC the newest avai lable?

Thanks all,

Jeff

Just received Nagoya NA-701 antenna. It is much better on VHF. I get into a repeater 5 miles away with it that did not hear me with the stock dummy load. However, the stock antenna on UHF to a repeater co-located with the VHF formerly mentioned was useable but , the NA-701 does not get in. I plan to carry both and use the one that works for the band I need at the time.

You can only program from the top line of the display... the lower line has nothing to do with the top line... ther is no "default" for the lower line .. you have changed it.
If it won't accept the new transmit frequency it indicates you already have set something in that memory spot... you will need to delete that channel before re-attempting to enter the receive and transmit in one flow

His actual site to sell the antenna's is at the bottom of the page. The "HT Saver" as he calls it is a jumper with your choice of connectors at each end. You can choose the length. It helps keep the strain of the thicker coax from damaging you connector on your HT.

http://www.2wayelectronix.com/Cable-Assembies_c5.htm

Try that link.

the xlsx menu file is really good.
no problem with screen reader accessibility there.
I didn't see one in pdf in the files area though...perhaps that is only
availible upon request in case someone doesn't have an excel reader.

Thats because you have to press Menu again to confirm the transmit frequency and then you'll get the Transmit Frequency messege

None of them sites have anything listed and neither does ebay (in the 10W-20W range).....well not unless you want a HF Linear and you can get that for like $50

Hi, and Thanks, Pit Bull!

I have been doing that in all of the repeaters I stored to memory. That problem came up last night for the first time. I finally reset to factory default as I need the practice setting up repeaters in memory. With your handle, Pit Bull, you may be unhappy to learn that the local District Court upheld a new law that declares pit bulls as dangerous and allows landlords to evict their renters if they don't get rid of their dog. Some renters have appealed and are refusing to move. My Grandmother In Law had a pit bull that we could pet and, to my knowledge, never harmed anyone.

Finally, do you recall a message on this user group last night that mentioned a couple more menu settings to reset and improve performence? I already disabled menus 7, 35, 36, 37, and 39. Think they were in lower 20s.

Thats because you have to press Menu again to confirm the transmit frequency and then you'll get the Transmit Frequency messege

I have been having several problems finding a workable software for my uv-5r. Can someone please post a url that works. I am using windows vista 32bit. I have tried just about everything. The closest thing I have had to working is not Chirp, but the regular uv-5r software but with question marks in the program task bar! Thanks Gary

I am confused. My menu 33 is BAND, does not have 0 as a
value. What am I missing here????

8220. Difference between 5 and 5+?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-18 05:58:53 UTC
From: E.Z. Pikens
Topic: 8220 Message: 8220

Hi,

I'm new here and searched for an answer to my question before posting this but did not find one.

I passed my Technician test on Saturday -- did it as a part of my CERT training.

So, time for a first radio. Is there a significant difference between the 5 and the 5+?

Lots of places seem to sell the 5, but I've only found one that sells the + model.

The price for each is the same. My inclination is to get the + because it's supposed to be a later model. Am I right?

Thanks in advance.

Steve

Here are the menus I would check after a Menu 40 (RESET)...

Menu 7 (TDR) = OFF ; toggle back on later if you want to use it
Menu 9 (TOT) = 90 ; or 120, but only if 60 is too short
Menu 14 (VOICE) = ENG ; if you have newer firmware
Menu 18 (SC-REV) = CO ; my preference, some may like default TO
Menu 32 (AL-MOD) = SITE ; so accidental alarms don't go over-the-air
Menu 35 (STE) = OFF
Menu 36 (RP-STE) = OFF

If programming by hand, I would set menus 21 & 22 to FREQ so
you don't get confused by the wrong NAME showing up. I found the
first memory you program in becomes the name for all the channels.

Topic: 8198 Message: 8224

Scott,
Good idea. I just move to the same channel on the lower display but that might be confusing for someone that is new.

When NAME is selected, my experience is that channels without alpha tags default to their channel numbers (CH-001, CH-002, etc.) when no alpha tag has been programmed. I'll have to program some channels after doing a reset to see if I can duplicate your experience.

Hi Gary

Part of the debugging that we go through is that we assume the software
does work. So, initially, that leaves us with the hardware to look into.

I wrote this some time ago for Ham Radio Deluxe. While it focuses on HRD,
the mechanics are exactly the same.

http://forums.hrdsoftwarellc.com/showthread.php?20432-How-to-debug-the-quot-not-reading-frequency-quot-error

I hope that there are some notes in here that may help you out.

Guys

I was in Tiger Direct today and I reluctantly picked up a StarTech USB/RS232 adapter that clearly said on it it was a Prolific driver (that is a first).

So, I brought it home and plugged it into an XP sp3 box, and it worked perfectly.

I then plugged it into a Windows 7 64 Bit and it also worked perfectly.

If you are looking for one that will work, this one you can trust.

Ho Colin,

Menu 33 is the band selection menu. Are you sure you don't mean menu 34?

You may want to try this Sabrent USB-2920 USB 2.0 to Serial DB9 Adapter - 2ft from Tiger at $14.99. This unit has a driverless FTDI chip in it according to the write up. The # Item#: M501-6001

It does only have 9 pins so for some apps you may need an adapter.

Yes John. Our club has both repeaters at a common site on antennas near the same height. I do n ot have an analyzer that covers 430MHZ so I cannot make a scientific comparison. However, The stock antenna on the UV5R gets in the UHF easily but not the VHF. The NA-701 is just the reverse. I am planning on constructing a coaxial bazooka for VHF and it should work on UHF at the third harmonic. Will keep you informed.

I bought them sort of as a test. It was the cheapest one that Tiger Direct had in stock (I actually have a store near me).

I wanted to see if current shipping hardware just works on 64Bit Windows7, and it does.

Also, if it didn't, then I could just take it back.

It is too bad the Chinese are using the older or cloned version of the ships and causing everyone so much grief. The USB programming cables should really be plug and play.

8240. New Group Member

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-18 15:46:39 UTC
From: Dan Ozment
Topic: 8240 Message: 8240

I just wanted to say hello and thanks! I got my new UV-5R yesterday, and struggled for about three hours loading and unloading Prolific drivers trying to get CHIRP to read the radio. I finally found this group, and one of the first posts I saw said something about it being kind of hard to plug the programming cable in all the way. I took a look, and in fact, I didn't have the plug all the way in. I gave it a little extra force (which seems like too much), and read the radio for the first time.

Seems like this will be a neat little radio - I've got VHF/UHF, narrow band, and 2.5k steps for less than the cost of a spare battery for my Yaesu VX-7R.

Thanks to whomever made the post about the cable being a little tight.

All

You might want to head this warning until Microsoft gets IE fixed. This is a serious attack.

http://www.thestar.com/business/article/1258278--new-security-flaw-leaves-internet-explorer-users-vulnerable-to-hackers

This is a zero day exploit on IE and it is 'in the wild' as they say.

For the time being, I suggest using Chrome or Firefox until Microsoft gets the fix out (no target date yet).

Please, no need to reply, etc. It is just an FYI.

Microsoft issued the warning: http://blogs.technet.com/b/msrc/archive/2012/09/17/microsoft-releases-security-advisory-2757760.aspx So it's not necessarily a slam. Microsoft did not, however, recommend using other browsers. Briann1bs

Thanks, Again, Colin!
I remember our discussion a couple of days ago including the fact that Menu 7 had to be reset to where factory had it before you could delete one of those 3 menu numbers you sent. I did it all then reset Menu 7 to 0 again. Forgot to save original message in folder so when cleared Deleted Files, it was gone. Meanwhile I did a full factory reset last night and wanted to fix everything back. It's now fine and your original message saved.

Not to hi-jack the thread, but if you read the article (maybe you did) you'll see that Microsoft has a fix that you have to manually install. Technet is a Microsoft project.

The fix is here:
http://www.microsoft.com/en-us/download/details.aspx?id=29851

However, this is not a trivial ZDE. It will do a command and control take over. There are many of these reported each week. This is one you need to heed.

Totally up to everyone here. Personally, I only share the news. I don't really care about opinions in case you hadn't noticed. :)

To stay on UV5R track, the author or the Hand Book for Radio Mobile emailed to thank him for the plug (Ian monitors this list) and he also elaborated on how he used his units this weekend.

So, if you have 'range' questions, he is one of the guys that you can listen to.

I've seen a couple of answers, but I think you're talking about the
channel names.

I don't use CHIRP, but I wonder if you should also check the settings of
Menu 21 - MDF-A and Menu 22 - MDF-B.

For U.S. customers, Import Communications (Ed Griffin) is testing the Anytone 588UV dual-band mobile and shows a price of $275 on his web site (www.importcommunications.com). As with other equipment, the price a higher than if purchased from China, but the delivery is probably quicker and the warranty, etc. is in the U.S. [My only connection to Ed / Import Communications is as a highly satisfied customer.]

For a novice, any one will be sufficient - they are all pretty similar, in function and performance, and they will all take the larger battery.

If you want the "biggest, baddest", then you probably don't want a Baofeng, but it is a good place to start, and once you've studied and taken the exams, you will be better able to make up your own mind as to what is the best for you, which depends on what you intend doing with it.

Follow some of the links at:
http://groups.yahoo.com/group/baofeng_uv5r/links
for more advice.

regards,

Gary,

Sounds to me that any of these units will suit your use. The standard battery lasts several days, the larger batteries only last longer , they don't have additional power so therefore there is not any "Big Guy" out there.

You would do well to read up on Ham radio before you spend your $$$, perhaps you are leaning in the wrong direction.

Good luck in your quest.

Seems like you would end up burning out the transmitter in these HTs. The duty cycle starts to become nearly 100% during a conversation.

You are right, mine shuts down on a long QSO with me around 75% TX. In a repeater set-up it would take 2 UV-5Rs one receive and the other transmit duty so it could go either way.

While it could work, the best use would be for the fun of it and not so much reliable communication... IMO.

Topic: 7932 Message: 8269

I haven't had mine shut down yet but I would say it's been close, the bottom of the LCD screen starts to look like it has been left out in the sun for a while.

One thing I have noticed is the duty cycle isn't as important as the total time spent transmitting.

I can TX short overs for a long time and it eventually overheats, I can TX looooong overs for a short amount of time and it fairly quickly overheats..

The overheating is basically cumulative with little regard to duty cycles, the duty cycle only dictates how soon before the overheating occurs..

Just my thoughts guys,

Cheers,

Rob.

Colin,

I think this radio is a sister to the Woxun. It too was supposed to be available this past Spring also. I do not believe that Ed will offer it unless he determines that it is a good value and meets the specs..... I'm on the list.

8272. Re: UV-5R As A Repeater

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-18 23:17:17 UTC
From: kg2gx
Topic: 7932 Message: 8272

A friend of mine set up a GMRS repeater using two TYT TH-9000 units. After about 2 weeks the transmit unit lost the final amp and was barely transmitting. He switched the two units around, and it's been working great since.

Set up Chirp like this

162.550 WX-1 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

162.400 WX-2 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

162.475 WX-3 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

162.425 WX-4 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

162.450 WX-5 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

162.500 WX-6 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

162.525 WX-7 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

And Canadians can add

161.650 WX-8 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

161.775 WX-9 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

163.275 WX-10 (None) 88.5 88.5 023 NN Tone->Tone off 0.000000 FM Low

No FM storage but remembers last tuned station, even after removing battery. Light Chinese accent on most audio confirm. ExpertPower antenna from Amazon refined VHF RX/TX greatly ($1.55 + $3.99 ship), no model # just 7.56" Dual band antenna SMA female. Moni/lamp button got hard to activate after four uses, not working anymore.

Change Menu 21 and/or Menu 22 from FREQ to NAME.

Menu 21 changes the readout of the A line (upper line), while Menu 22 changes the readout of the B line (lower line).

I would add an 'S' to the end of each so they all will be skipped when scanning.

When using CHIRP, there are 2 tabs on the left,
Memories and Settings.
Using the Settings tab, are you changing the display mode of A or B
To Name?

8285. Baofeng Battery Charger

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-19 04:10:40 UTC
From: John Kolb
Topic: 8285 Message: 8285

I traced out the schematic of the battery charger and put it in the Files section, titled UV-5R Charger.pdf Also on the schematic page are some voltage readings. I was inspired to do this after reading on Battery University
http://batteryuniversity.com/learn/article/lithium_based_batteries
that some chargers go into a constant trickle charge at the end of the cycle which is bad for Li batteries. I was glad to find that the charge current goes to 0 when the light goes from red to green on the charger which came with my UV-5R.

The SC-6038 IC manufacturers website says the IC has an input of 9-18V, output 8.4V, however I think I saw somewhere the Baofeng charger has a max input of 10.4V. This would be because the IC would need a considerable heatsink to drop the voltage from 18 V to 8.4V at 375 mA battery charging current. It would be a neat hack to add a voltage regulator inside the charger base to drop 14.7V from a car electrical system to 10V for the charger.

yep, that's the beautiful thing about using a pair of transceivers back to back in a repeater...if the tx or rx goes out, you simply flip flop them and your back in business.
or if it's in a difficult to get to site, you can simply bring along another transceiver programmed with the right freqs and tones, and replace the unit. That's pretty hard to do with a typical repeater.
have your friend check the solder joints at the final in the radio...often over heating can cause cold solder joints or shorted traces etc from melted solder.
A trick we've kind of learned is to put high grade silver solder at the finals to deal with some of the heat issues.
Kenwood repeaters are known for this apparently as well.

Yes of course its possible, simply transplant the same size with colours of your choice, if you wanted, you could use two led's if you make new holes, then you can have left and right avoiding colour confusion.

8289. Which is the new '2013' model: UV-5RA or UV-5R Plus?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-19 08:16:38 UTC
From: ryme.intrinseca@btinternet.com
Topic: 8289 Message: 8289

I have ordered a 'UV-5R Plus' from Ebay, here in the UK. The seller has described the Baoefeng 'UV-5R Plus' as the 2013 model and therefore a new release.

However, I noticed another seller, this time in Hong Kong, on Amazon, selling a 'Baofeng UV-5RA' model and I have to say of the two models, the 'UV-5RA' looks the most up to date of the two.

'Just wondered if anyone can explain the model classifications as they currently stand? . . .

Many thanks,

M.

John,
Nice schematic.

Despite the label on the bottom saying "Input:DC 10V", my charger base came with a 12v 1000ma power adapter.

The Baofeng charger base will shut itself down when the input voltage gets up to around 13.2 volts. So I've had mine working from the car 12v accessory jack with the engine off.

The label on the bottom of my TYT BCG-F8 charger base (which is the charger that I use for my UV-5R), says "Input: 13.8V DC". It came with the exact same 12v 1000ma power adapter as the Baofeng charger base. It operates fine in the car with the engine running.

Except for the stickers on the top and bottom, both charger bases look identical externally. The UV-5R feels solid in the TYT base and feels sloppy in the Baofeng base. Internally the the circuit boards are different.

On a Baofeng charger base with the bottom removed, you can see components on the circuit board. On the TYT charger with the bottom removed, you can't see any components (they are all on the other side of the board). Unfortunately I never tried to get the board out of the TYT charger base to see if it uses the same IC chip.

It would be an easy modification - the LED looks like it's 3mm diameter, leads
are 1/2" long.

Unlike Jim's unit, my power adapter outputs 10V. The label on the bottom
of the power adapter says Output DC 8.4V and has pictures of the red and
green LED's so is talking about the charger charcteristics rather than the power adapter.

No hack needed if you don't mind adding an external part, a Buck voltage regulator can be bought cheap on ebay, and it can be step up or step down DC-DC conversion depending on what you want to do, also available are two wire voltage displays so you can do away with your multimeter, simply turn the screw for desired voltage.

8293. HELP: Software for UV5R-UU

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-19 10:57:01 UTC
From: astodut
Topic: 8293 Message: 8293

Hi,

I got new Urom UV5R-UU from 409shop.com, It has long slim antena, 2 modes led, 420-520 freq, and 291 firmware.

The problem is CHIRP or OEM software can not communicate / read from the radio.

My USB cable could connect and read from my other UV5R which has 251 firmware. So I think the problem is not from the cable...

help me please...

8294. Re: Firmware, version and improvements data; please post

```
Serial number: 1160002108

Receive : September 14th 2012

3 key BFB : 291

6 key VER-05: 1208822N B5R0001

Vendor : UV5R-UU by from 409shop.com

Bug: Software both OEM and CHIRP can not detect radio, I have 06 pcs of
UV5R-UU, all have the same problem. CHIRP sucsessfully read my UV5R
(BFB251) using the same USB cable.
```

Astodut,

I went to the 409shop.com and could not find a UV-5R-UU. I do believe that most of the suffix has to do with the items in the package and is not related to the specifications of the radio itself.

I would ask that you confirm that your original UV-5R still talks to your software using your existing cable. If it does then swap the units out at the radio end and try again. If at this point none of the new units talk to your software then you either have a bad batch of new radios or they are indeed of a different Firmware. If you find that this is the case then you need to contact the 409 Shop for direction.

JL

Subject: [baofeng_uv5r] Re: Firmware, version and improvements data; please post

Serial number: 1160002108

Receive : September 14th 2012

3 key BFB : 291

6 key VER-05: 1208822N B5R0001

Vendor : UV5R-UU by from 409shop.com

Bug: Software both OEM and CHIRP can not detect radio, I have 06 pcs of UV5R-UU, all have the same problem. CHIRP sucsessfully read my UV5R (BFB251) using the same USB cable.

M.

I do believe that most of the suffix used has to do with the items in the package and is not related to the specifications of the radio itself except perhaps the color.

Many of us have been led to believe that "New" meant the very latest when often, since they are on Ebay, refer to the offering as 'new' compared to a used item.

All this is not to say that the offering is not indeed a 2013 model. Confirmation of that should come from your point of purchase. I have had very good response from all China folks including Baofeng factory when I have had a question of this nature, just be careful to word it clearly as interpretation is often an issue.

Subject: [baofeng_uv5r] Which is the new '2013' model: UV-5RA or UV-5R Plus?

I have ordered a 'UV-5R Plus' from Ebay, here in the UK. The seller has described the Baoefeng 'UV-5R Plus' as the 2013 model and therefore a new release.

However, I noticed another seller, this time in Hong Kong, on Amazon, selling a 'Baofeng UV-5RA' model and I have to say of the two models, the 'UV-5RA' looks the most up to date of the two.

'Just wondered if anyone can explain the model classifications as they currently stand? . . .

Many thanks,

M.

From 146.800 to 147.500 my UV-5R kick out almost 8 watts. Tested with a Bird 43 and a Bird dummy load. Anyone else have this happen?

Me neither. I printed out lists from these (and other) sites, and
entered them into Chirp manually.

Chirp is supposed to import/lookup repeaters from a couple of other
sites, but that function does not work for me (OSX). I haven't bothered
to find out why yet.

On 9/17/12 11:44 PM, Mick wrote:
> sadly, i can't seem to d/l any useable .csv or .tpe files for my area from the first link (K5EHX). i was hoping to just get a .csv file and load it into the new HT. (and program using chirp)

Sorry somehow I missed that on my first visit to the 409shop.

There is a difference between the RE and the R. Looks like perhaps they added a metal front. Spec wise I can not see why there would be any difference in programming with the exception of the 520mhz limit.

I am curious as to what you find out.

Hi JL,

Baofeng UV-5R UU link: http://www.409shop.com/409shop_product.php?id=108832

John;

I had noticed this same thing, that the drop-in charger would stop operating when I plugged in a so-called UV-5R DC car charger. I put it on a variable DC power supply and found that it was OK (the charger would operate and charge the radio) as long as I was below 12.6 to 12.8 volts input to the base of the charger.

I do not recall the actual voltage, as I had conducted this experiment several weeks ago.

The first charger that I got (listed as a car charger for the UV-5R) was simply a straight-through device with only a paralleled circuit to operate the LED.

I "resolved" the issue by getting a one-size-fits-all DC power source; It was adjustable to allow several output voltages, and had several plugs. The polarity of the DC voltage was not at all evident, so I verified the needed polarity with a volt-meter before I tried the new unit. This new (variable voltage-polarity-plug) set appears to work well. It was well under $5 on eBay.

The bottom line is that the original DC car charger will now work as long as the vehicle's engine is not running; Ar rest, the DC voltage would allow the straight-through charger adapter to run the drop-in charger just fine. (Running voltage is about 14 volts, and when the engine is off, the voltage is well below 13 volts, which was OK.)

John, I applaud your efforts to draw the schematic and even reference some voltage points, etc! (GREAT work!) (THANK YOU!!!)

From your start, we can possibly modify the charger to accommodate a wider span of input voltage.

reading about difficulties that people have at getting cable plugged-in in general, I think it's possible that UV5R-UU modification may have a slightly different construction of a connector panel (like the plastic is slightly thicker or socket from a different vendor, with 1/10 of a mm off), preventing your cable plug to reach the receiving connector properly.

other thought - baofeng has changed FW slightly and so it would talk to data cable only in a certain mode. Try connecting while using different modes of mem/freq and A/B. Or it's possible that something was changed in the protocol, so neither CHIRP nor OEM software detect some control chars in communication. Speaking of which - what kind of error CHIRP gives you? Did you try to start a terminal on the COM port where radio is connected and see is there any activity at all?

that's very abnormal.
and I would tend to suspect your test equipment before thinking the radio is actually putting out double the rated power.
the radio heats up like crazy on 4.3W output, it would fry eggs after 60 seconds with 8W output.

Well it's here!

My UV-5RC from import communications showed up today. So pumped to use it tomorrow. All I had time to do tonight was install the battery, belt clip, and antenna upgrade then quickly punch in a local police dispatcher freq. which I was successful in accomplishing. I also tried to tap into the local repeater but I dont think that went so well for me, this time. Tomorrow is another day for another success. I need to make that "first HAM contact"

Be aware, Red, Yellow, Green and Orange Led's work on 1.8 to 2 volts, White, Blue and Purple need 3 to 3.5 volts for proper operation.

For 3 mm LEDs, 7 ma - 10 ma is plenty, maximum is 20 ma.

For LEDs check out:

www.led-switch.com

and

www.moreleds.com

One interesting LED is the 3 mm 12 volt "warm white" LED, which can be used to light meters in amps. Or just use a regular 3v warm white LED with 1k - 1.5k 1/4w resistor in series. The "warm white" is the color of incandescent bulbs.

Maybe I missed this and it's old news but it appears the tone squelch issue (higher tones not working with scan) seems to be fixed in the E model. I am testing various repeaters and they are opening in scan mode now with tones up around 156.7 and 167.9.

8312. Re: [baofeng_uv5r] Tone squelch issue fixed with UV-5RE

the original issue with scan not stopping on frequencies with a ctcss tone,
only effected tones below 136.5.
So the original problem didn't effect tones above 136.5
At least that is how I understand it.

The UV-5R scan 'bug' is for receive CTCSS (menu 11 (R-CTCS)) settings of 136.5 Hz and lower.

We speculate that as the UV-5R scans through channels, it only waits a fixed length of time to determine if it is receiving a signal, and in the case the channel has an R-CTCSs tone programmed, the correct tone can be detected, before moving to check the next channel of activity.

The lower the frequency, the longer it's cycle is. Longer cycles increases the length of time it takes to transmit, receive and ultimately detect its frequency. So on the lower tones, it takes longer to detect the correct tone than the UV-5R allows before moving to the next channel.

Unless you are battling a lot of receive interference (and you are positive the station you are listening to is transmitting the correct tone), it is recommended that R-CTCSs be set to OFF anyway. So for most UV-5R owners this bug isn't an issue.

Hi Folks,
Can anyone help me please.

I am using Chirp daily-20120605 & I am trying to load the memories.

For my local repeater I put in frequency 145.637500 Name GB3DN Tone 77hz
Duplex - offset 0.600000 then save as Baofeng UV-5R channels.img

I then upload it to my UV5R can receive on the repeater & I can hear my transmission on the input but unable to raise repeater.

So go back in & the tone shows 88.5 so after reading Jim KC9HI notes on
Miklor web site I deleted the row & started again have now done this 3 times & get same result it will not hold the 77hz CTCSS.

My question is am I doing something wrong? or do I need to update Chirp software maybe there was a bug?

Kind Regards
Phil G0BVD UK

Try right-clicking on the left end of the channel row and then select EDIT from the menu that appears. See if you can tse that to enter the 77 Hz tone frequency. See if that helps.

If that doesn't resolve it I will try it out after I return home from work to see if I can reproduce the issue you are having.

Channels added via the key pad are always added as channels that will be scanned. What you can't do via the key pad is add channels that are skipped when scanning.

Hi Phil -

1. Be sure that you have selected "Tone" under the <Tone Mode> column.

2. After selecting the tone frequency (77hz) under the <Tone> column, be sure to move OFF that particular line BEFORE saving the file. (In my case, the tone frequency would revert to 88 if I did not move off the record before saving.)

3. Save the file.

4. Upload to the radio.

John,
That was going to be my next suggestion. I was hoping the alternate edit window would get around that until I got a chance to verify what you described. To let me clarify for Phil, 'move off' means 'click in another cell' to make the tone value 'stick'.

8326. Re: Tone squelch issue fixed with UV-5RE

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-20 16:19:31 UTC
From: crcrane@sbcglobal.net
Topic: 8311 Message: 8326

I see now. I had the issue backward.

But, after doing some more testing it seems as if the CTCSS tone filter is working properly while scanning at the lower frequencies but now instead of not unmuting higher tones it's just operating as carrier squelch and opening on anything. I tested a channel with 167.9 in TSQ mode and then transmitted with no tone from a different radio and it's unmuting while scanning when it shouldn't.

I wish they would have put their effort into fixing this instead of messing with new case designs. Computer and consumer device generic interference keeps me from scanning with this thing unless I'm outside.

Phil,
Do the rest of your channel programming with CHIRP and upload to the HT. Then either download into the OEM software and edit the tone and reupload back to the HT or key in that channel into the UV-5R using the keypad. Then you can download it into chirp. I believe CHIRP will honor the setting as long as you don't edit that channel.

I'll try to take a look at it after work and see if there is anything else that could be done.

8330. Chirp or Baofeng programming software?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-20 17:06:13 UTC
From: yahoobud
Topic: 8330 Message: 8330

I am still waiting for my UV-5R to get here... I should be getting it in the next week.

I am a little torn between using Chirp or the factory Baofeng programming software. I read about a few issues with Chirp and also the factory software is not perfect either.

I am kind of leaning toward using the factory software because it has all the setting in 'Optional Features' that you can't access with Chirp.

Thanks, I am enjoying all the posts here.

I would work 'em both..... doesn't cost anymore and it will either help your learning curve or drive you nuts. If you want to program another brand of radio with the same frequencies it will be easier if you are using Chirp.

8333. Unable to receive packet / APRS with UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-20 18:49:36 UTC
From: caimaver
Topic: 8333 Message: 8333

I was hoping to use my Baofeng UV-5R as a cheap, mobile and easy to replicate APRS digipeater or I-gate. I've been successfully using my Kenwood TH-F6 in this role, but I'd rather devote a cheaper radio to the role. I had seen a few messages in this group saying the the UV-5R would be good for packet.

I've been testing my UV-5R for the last two weeks and I'm unable to receive packets with much success under a variety of setups. The setup that works for my Kenwood uses a roll-up J-pole as the antenna and either an Open Tracker+ or a Open Tracker USB as the TNC (in KISS mode). The radio operates open squelch and successfully receives an avg couple dozen packets an hour from ~20km radius. Works great.

I swapped the UV-5R in place of the Kenwood and receive a maximum of 2 packets in 24 hours if I'm lucky. I matched the UV-5R volume to be about the same as the Kenwood's, but also tried other volume settings with no benefit. I'm running the UV-5R open squelch and I'm using these relevant settings:
- SQL = 0
- Batttery Save = off
- Dual Reception = off
- R-DCS = off
- Squelch tail elimination (STE, RP-STE, RPT-RL)= off

I've also tried swapping the J-pole for the stock antenna in case the receiver front end was getting overloaded and distorting packets, but that didn't help either. When I disconnect the TNC cable, I can *hear* packets, but obviously they're not clean enough for the TNC to decode somehow.

If anyone has gotten packet receive to work on their UV-5R, I'd love to hear about your set up. Several Google searches and searches within this group reveal folks using the UV-5R as a tracker (APRS transmit only), but haven't found any examples of packet Rx. I wonder if the off-frequency receiver problem I've read about is causing this problem.

Any suggestions appreciated.

Just get the UV-5R file on here thaqts patched and the UV-5R setup files and install them first as it needs VB Runtime files and it works and is REALLY simple.....I've been making and fixing PCs for 14 years and I could get a 2 year old to program the radio with no problems with the program on here

Topic: 8335 Message: 8339

A ground plain is typically a quarter wave out from the center radiator.
best way to figure out the quarter wave of any frequency is:
quarter wave: 234 divided by the frequency:
234 divided by 446 equals 0.52. It's the measurement in feet, not inches.
simply multiply this by 12, to get the length in inches instead of feet.
in this case, it is 6.24 inches or so.
Same is true for any frequency.
So, for VHF it would be:
234 divided by 146.00 equals 1.6FT.
1.6 multiplied by 12 equals 19.2 inches.

so, for UHF, you want a ground plain of at least 6 inches out from your
center radiator, and 19 inches out for VHF.
If you are building a quarter wave antenna, the center vertical radiator has
to be 6.2 inches on UHF or 19.2 on VHF...of course these measurements will
alter slightly if you want to optimize the antenna for certain frequencies.
You can form your ground plain out of 3 or 4 radials or elements...the
antenna will see these as a plain without having to have a solid metal
surface if you will.
You want to probably angle your ground plain elements down at about a 35 to
45 degree angle as well.
I successfully used a metal coffee can and coat hangers to build my first
VHF quarter wave ground plain antenna.

hope this helps.
ask more questions if something isn't clear.

if you cut the center radiator exactly to about the 3rd decimal point when
you make the calculation, it should be pretty close as far as swr.
if you have an swr meter, cut the center radiator just a bit long so you can
trim it to achieve the best results.

8343. Re: CTCSS

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-20 22:21:48 UTC
From: Jim
Topic: 6410 Message: 8343

Phil,
As I mentioned at lunch time, once I got home from work I would try this out. I have been using CHIRP daily 20120730 and I was able to set Tone to 77.0 Hz without any issue.

The configuration was saved to a file and then the file was retrieved with 77.0 Hz remaining in the correct cell. I also uploaded to the radio and then downloaded from the UV-5R and 77.0 Hz correctly stored in the HT and retrieved back into the spreadsheet view.

I then upgraded to the latest CHIRP daily and had the same success with it. Clearly this is not a CHIRP issue.

My question now is how are you selecting 77.0 Hz. I did it both in the spreadsheet view and the right-click edit view by clicking the cell and then clicking the triangle to the right of the cell and then selecting 77.0 from the drop down menu. Is this what you are doing or are you doing something different?

What OS are you using? I've got Windows 7 64-bit here.

I agree with John. I have all 3 on my computer (OEM, OEM VIP and CHIRP). I just use whichever one does the job I want to do best.

I might try that and thanks and also I dont have a SWR meter for UHF but I do for 27MHz and as you know that is COMPLETELY useless for UHF and pity a simple mod wouldnt make it into a SWR Meter

That's funny Pit Bull 8-)

I'm just near you in Melbourne and the weather forecasters can't get it right here either

Admittedly though, we do get 4 seasons in one day... 8-)

Cheers,

Rob.

ok, just cut your center radiator as close as you can get it, and it'll
probably have decent enough swr.
An HF swr absolutely won't work on VHF or UHF...circuitry is all different.

Thaks for that and it looks like a nice size but I wouldnt run that on my handheld radio:P.....I've noticed they only seem to make'em for 2M and70cm radios,pity nothing that small could be used for 27MHz cause for that size it would b a F***in closeline and a 4M pole somehow insulated on the top

Does anyone think a TV antenna could be used as a 477MHz antenna or atleast some sort of antenna that could be used for transmitting,I was looking at a UHF Antenna for TV yesterday and it was the same design as the one I found on google for a UHF CB Radio Antenna and the measurements looked pretty close aswell

fantastic stuff.
Like I said, I used a large *2 pound?* metal coffee can, drilled a hole in the center of what was the bottom of the can to mount the so239 connecter. Then, using some coat hangers that I straightened as much as I could, I cut one to 19.5 inches, scraped off about half an inch of the non conductive coating , and soldered it to the center pin of the so239.
Then, I drilled 8 holes around the can. Basically 2x4 holes about an inch apart from near the edge of the can towards the center, and 90 degrees apart.
The two holes were to thread the ends of the ground radials through and keep them in place. I then cut 4 20 inch long radials, scraped the ends free of about an inch and a half of the coating, and threaded them into my holes...Then bent the radials down at about a 40 degree angle from the edge of the coffee can.
Then, I drilled a hole near the bottom edge, what used to be the top rim of the can, big enough to allow an RG58 coax to pass through. Then I crimped on a pl259 connecter to connect to the so239 inside the can.
All of this was done with a coffee can so I could place it on the top of the hutch on my desk. The radials may not have been at a 40 degree angle at the end, but I bent them so that when the coffee can sat on a flat surface, the radials angled down and the tips touched the top of the hutch.
I used perhaps a 4 foot run of rg58 down to the radio I had at the time mounted under one of the shelves on my desk.
It worked reasonably well to get me into most of the local 2M repeaters.
Of course I soon graduated to a large outdoor base antenna so I could work simplex with reasonable and reliable success.
the old droopy quarter wave antenna works well though, and most certainly better than the stock duck.
I like some of the ideas in both the w6JMF article, as well as the project article he had linked to in his article.
Making a vertical dipole using small PVC pipe and rg58 coax, shorted at the ends to make a physically shorter element also sounds like a really cool idea. I've seen plans for making yaggie's like this, and making a 2M vertical dipole, or even a magnetic loop using these kinds of materials seems easy.
A magnetic loop on 2M is also a far better alternative to a stock duck, and even easier to mount and hide away than a quarter wave with ground radials. You can use 75 ohm coax for the matching stub, as well as for feed line and tune the antenna acordingly.
It takes a bit more math/formulas to figure out the tuning stub length and so on, but at the end, you'll have an antenna that will be just slightly better than a quarter wave as far as gain and directivity goes.

for 27MHZ it would be around 9 feet long lol.
although, you can make a magnetic loop that is 18 inches square for 27MHZ.
narrow banded of course, but it would work if you designed it for a
particular channel.

8362. Satelite Dish For Antenna

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: Pit Bull
Topic: 8362 Message: 8362

I've got an idea for a directional antenna for the UV-5R and all you need is a satelite dish,PL-259 connector and some wire (or just a standard UHF base and 3-4.5db whip) and all you need to do is drill a hole in the middle and put in a antenna,join it upto our radio and if you do alot of talking on a repeater just point it in that direction.
Then thers always the option of a VHF or UHF Linear aswell.

You can also take the 234 and multiply by 12 and use the freq / 2808
and get a direct result in decimal inches. Add the 5% for the 45
degree drooping radials.

the elements would have to be trimmed, or lengthened to make it resonate
properly on the frequency you want to transmit on.
Also, you would have to modify the feedpoint matching system to make it
present a 50ohm feedpoint impedance on the frequencies you want.
TV antennas are also designed for receive only, so any coils and caps and so
on are not designed for tx level RF to go through them generally speaking.
You might think about looking up designs for quad type directional antennas
for the UHf band...they're easier to build and somewhat smaller in form than
a yaggie for the same frequency.
a quad style is where you have a vertical and horrizontal spreader and a
wire strung around the spreader in a diamond shape or 4 sided loop.
you could easily make a small 3 element quad that wouldn't have more than a
1FT boom length, with spreaders around 6 inches long...that would give you
about 4DB gain I believe.
the trick on a quad is the feed point, but there are, again, lots of designs
on the web for such things.

Well, you asked for a ground plane antenna for UHF and VHF, and this is precisely that, with diagram and formula. There are no variations, physics and math and all that being what they are.

If you build one of these, you can build it directly on the SO-239 panel mount socket as shown. I suggest not trying to solder the ground plane elements to the SO-239 flange. By the time you get it all hot enough to solder you'll melt the insulator. Instead, solder ring terminals to the ground plane elements, and attach them with small (4-40 is good) screws and nuts, with lockwashers. The vertical 1/4 wave element can be easily soldered to the socket.

Brass brazing rod is an excellent material for this, and an antenna built according to the link will work well. I've built one myself. Later I trimmed it a bit for 161 mhz and gave it to a friend who has it in his attic for monitoring railroad frequencies.

73,
Paul - AE5JU

Jim,
I am doing exactly as you are saying but still no joy. This morning I opened up Chirp program without the radio connected opened up the saved file Baofeng UV-5R channels.img* the VHF/UHF repeaters I put 1 in memory 0 & the other in 1. 1st I tried again putting in 77hz & saved line same on other line then closed down the spreadsheet & Chirp.
Open up chirp again & file & it showed 88.5hz again so this time deleted the rows put all the information each line & after each line saved. Looks right on the screen uploaded the info still no CTCSS tone downloaded back to the spreadsheet comes up showing 88.5hz sadly

One think I did notice at the bottom of the spreadsheet right hand side it says (0) Completed writing memory1 (idle)

I am also using OS Windows 7 64-bit

Jim, Just another update. Put in 3 new repeaters for a area I will be travelling to. Opened up Chirp opened up the spreadsheet put in the 3 extra memories with different CTCSS tones saved it then uploaded it to the radio. Closed down the spreadsheet reopened it & all the CTCSS tones were back to 88.5hz. Everything else was saved ok just the Tones are not saving. Starting to drive me mad now! Phil G0BVD UK --- In baofeng_uv5r@yahoogroups.com, "Phil" wrote: > > Jim, > I am doing exactly as you are saying but still no joy. This morning I opened up Chirp program without the radio connected opened up the saved file Baofeng UV-5R channels.img⋆ the VHF/UHF repeaters I put 1 in memory 0 & the other in 1. 1st I tried again putting in 77hz & saved line same on other line then closed down the spreadsheet & Chirp. > Open up chirp again & file & it showed 88.5hz again so this time deleted the rows put all the information each line & after each line saved. Looks right on the screen uploaded the info still no CTCSS tone downloaded back to the spreadsheet comes up showing 88.5hz sadly > > One think I did notice at the bottom of the spreadsheet right hand side it says (0) Completed writing memory1 (idle) > > I am also using OS Windows 7 64-bit > > Phil G0BVD > > > --- In baofeng_uv5r@yahoogroups.com, "Jim" wrote: > > > > Phil, > > As I mentioned at lunch time, once I got home from work I would try this out. Phil, I got up this morning and after reading your reply decided to do some experimenting to see if I could duplicate you experience. I was thinking that something else about the repeater that you entered was affecting the Tone column. So the first thing I did was go back to your original post and created a channel for the GB3DN repeater as you described it. The channel entered without a hitch. The file was saved and retrieved and 77.0 was still there as it should be. Now I'm thinking if a properly configured channel works, what column could be overlooked to cause CHIRP to behave this way. I thought about it a minute or two, made a change, and sure enough duplicated the circumstances where CHIRP reset the Tone back to 88.5 as the file was saved. So my guess now is that you are overlooking the Tone Mode column and leaving it set to (None). If I am correct about this, your solution is to set the cell Tone Mode column to Tone and CHIRP will then retain the 77.0 (or any other CTCSS value) that you set in that cell. Jim On Fri, Sep 21, 2012 at 3:39 AM, Phil wrote: > ** > > > Jim, > I am doing exactly as you are saying but still no joy. Hi guys:

I looked in to this a while back. It was a bit labor intensive an I never had time to try it. It's an old article on the arrl site.

In the 60's a company, Finco, manufactured a Ham antenna called "The Finco 6 &2". It was a stelth antenna designed to look like a TV antenna but it was a 50 ohm coax fed, dual band antenna. I'm surprised no one is selling something like that today.

Jack WA9FVP
Willco Electronics.

8382. Defective UV-5R received from Radioshop888 no resolve had to open claim

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-21 14:35:09 UTC
From: Marc
Topic: 8382 Message: 8382

I ordered a blue radio for my Daughter. The charger will not charge the battery. When the radio or battery are placed in the charger, the charge LED state changes from orange/green flash to solid green. The LED never turns red.

I notified radioshop888 September 8th, received A response on September 10th wanting to confirm if it is the charger or battery that is bad and they will replace. I responded and said how can I determine this if I do not have another to swap with?

No response, followed up with another email and was ignored.

Opened PayPal dispute today.

Marc

Marc,

Check the output of the charger with a VOM. If it puts out 8.4 volts it's probably the battery, if not it's the charger. I have found Radioshop888 to be quite responsive to any questions that I've had, sorry to hear that you have had a problem.

Yes Paul, the DealExtreme cable works fine on the UV5R and also on the HongLitong UV-8R.
Ahappydeal.com has it for $4.82 (http://www.ahappydeal.com/product-68886.html).
My XP computer uses the older Prolific driver, so I don't know if this uses a clone chip or not.

Marc,

So does the radio not turn on?

Another person had the same issue, but the reason the charger went to green when the battery was inserted was that the battery was shipped fully charged. After it discharged some from use in the HT, it caused the LED to go red and charge as expected.

The DealExtreme price includes shipping. I could be wrong, but I don't think the ahappydeal.com price does. Just be aware of that difference.

Mark, are you sure the battery is not fully charged already? Leave it
on a NOAA wx or an FM station till the battery
symbol on the display goes
down to 1 or 2 bars instead of 3 to run down rapidly.

You might list your
location in a message to see if there is anyone in your area on the list which
can assist with different battery or charger.

while I agree with the sentiments of these posts, I'll just say that pit bull is a non-native english speaker/writer.
Quite often, the first words that are learned in a new language are the graphically descriptive ones :)
and if he's been listening to 27MHZ frequencies on skip from state side, his grasp of english could be rather tilted in that direction hi hi.
or, for that matter, if he picks up the occasional 75M phone band QSO, it could be leading his vernacular in that direction as well lol.

Pit bull, try to keep it professional on list as we have nearly 3000 members from all parts of the world.
dropping the F bomb and using other shall we say curse words or graphically descriptive language is going to offend some and lessen the impact of what you have to say.
It's ok for "pitbull" the artist to swear and say that kind of stuff in his songs on public radio, but it isn't necesarily going to be acceptable on an email list :)

8391. Aftermarket Antennas

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-21 19:55:42 UTC
From: Chris Ruhl
Topic: 8391 Message: 8391

Hello, Group

I wanted to share some of my experiences with group concerning aftermarket antennas. Perhaps somebody's already mentioned this. If so, I apologize!

Out of habit, the first thing that I usually do with a new HT is to obtain an aftermarket antenna as the stock antennas usually are not much more than radiating dummy loads. I noticed that the stock Baofeng antenna got rather warm.

I found what was supposed to be a Diamond Antenna model RH-701 at a local hamfest. To make a long story, the antenna is a fake Diamond antenna. Diamond in Japan does in fact make a RH-701 but it has a BNC connector, not a female SMA. The only female SMA antenna that Diamond makes, from what I saw, is the SRJ77CA. The yellow bag is very close, but the letter "E" in Antenna does not have a crisp diamond. The blue lettering on the base began to smudge. Moreover, the antenna is actually dangerous to the UV-5R, at least on VHF. I attached the fake Diamond to my antenna tuner and found the lowest SWR was at the very low end. 145.000 Mhz was 4.6:1, up to 6.0:1 at 147.000 Mhz. It's almost 7:0 to 1 at 148.000 Mhz. The antenna is actually cut for some VHF aircraft fequencies with its lowest SWR at 134 Mhz.

I tried my real Diamond SRJ77CA and found around 1.5:1 or less all throughout VHF. I then tried the stock Baofeng antenna and found its SWR rating to be just as good. Thus, from an SWR standpoint, the stock Baofeng antenna is better!

For grins, I tested my Wouxun stock antenna and found that its SWR is between 2.6:1 to 3.3:1 on the repeater end of amateur VHF. I've used that on the UV-5R and obtained much better results. For the record, the Wouxun's sweet frequency is around 160.000 which means it would do well with railroad radios or commercial VHF down to about 155 Mhz before it goes off the scale.

I knew something was wrong when I tried to use the fake RH-701 and got signal reports worse than if I used the stock Baofeng or stock Wouxun antennas.

Well I wasn't offended but a bit surprised to see it on this group.
On others it's a regular occurrence but that's a different "clientele". :)

I mean, I slipped an off color remark in once and got my lips smacked...

> >
> > other thought - baofeng has changed FW slightly and so it would talk to data cable only in a certain mode. Try connecting while using different modes of mem/freq and A/B. Or it's possible that something was changed in the protocol, so neither CHIRP nor OEM software detect some control chars in communication. Speaking of which - what kind of error CHIRP gives you? Did you try to start a terminal on the COM port where radio is connected and see is there any activity at all?

Topic: 8401 Message: 8401

Dont bother trying to get 2M on a UV-5R in Tasmania cause it cant be done and theres no repeaters around either so its only useful for simplex on VHF and UHF seems to be fine

Peter,

Have you tried the factory software and gotten the same results?

I checked the Baofeng website thinking that may be an updated version and only the 4/29/12 software is listed.

Looks like Diamond is offering a second SMA Female HT dual band flexible antenna, the SRJF10

I have not seen a picture. HRO has them listed for sale, Diamond facebook page says "coming soon."

Pit Bull

No 2M in Tasmania? Nothing could be further from the truth. Not only are there plenty of 2M repeaters in Tasmania but many of them are linked, including links to some on 70cm. In fact, we have a fairly unique situation of being able to have handheld radio communication across most of the State (for those of you living elsewhere, Tasmania has a land mass almost the same size as metropolitan France and a climate similar to Spain and we spreak english.)

Among the radios I use to access that repeater network are my UV-5R and two UV-3R. If you cant get yours to work on our repeaters then you simply have programming problems.

From your posts to the group to date, I would really recommend that consider joining an amateur radio club where you will be able to get on-the-ground advice and assistance. In Hobart you have one of the best clubs in the entire country - REAST. Please look up www.reast.asn.au and go from there. I'm at Powranna, 2 hours up the Midland Highway, so I'm a bit distant to offer face-to face assistance. Do you a working copy of the software and cable installed?

Bill

8408. 7.4V 3600MAH battery

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-22 00:09:54 UTC
From: jeffm1977@comcast.net
Topic: 8408 Message: 8408

Hello all,

I received a Baofeng UV5R-C yesterday from Import Communications and two of the extended batteries, the 7.4, 3600 mah, big battery. When I go to put it on the radio, it doesn't snap in place like the standard battery that comes with the radio. However, I tried it on my older version, just UV5R and it snaps in place with no problems. Any ideas???

Jeff,
N3TAY

i've read that some have had to file on the battery (or the radio frame?)
to get a fit. it doesn't sound like a major operation. you might look back
in the messages to find some of these posts.

yep, I and some others on list and locally have had the same issue, though not everyone does.
Best fix is to use some kind of file, and file down the inner lip of the clip at the top of the battery itself.
It doesn't take much. One method is to use a thin emery board, like you would use to file your nails, and slide it back and forth a few times. Make sure you keep the filed surface as flat and at the original angle....IE straight up and down, as you can.
it's a mattter of millimeters in most cases and doesn't take much to file enough plastic away to allow the radio clip to engage.
There is some issue with the bigger battery case not meeting up perfectly at some point, and so it doesn't slide up far enough to let the clip on the radio engage the lip on the battery.

let us know how you make out.

Subject: [baofeng_uv5r] 7.4V 3600MAH battery

Hello all,

I received a Baofeng UV5R-C yesterday from Import Communications and two of the extended batteries, the 7.4, 3600 mah, big battery. When I go to put it on the radio, it doesn't snap in place like the standard battery that comes with the radio. However, I tried it on my older version, just UV5R and it snaps in place with no problems. Any ideas???

Jeff,
N3TAY

Non-native english speaker/writer? What led you to that conclusion?

Bill, VK7MX - two hours north of Hobart, Tasmania, Australia.

On 22/09/2012 4:33 AM, Colin McDonald wrote:

☐
while I agree with the sentiments of these posts, I'll just say that pit bull is a non-native english speaker/writer.
Quite often, the first words that are learned in a new language are the graphically descriptive ones :)
and if he's been listening to 27MHZ frequencies on skip from state side, his grasp of english could be rather tilted in that direction hi hi.
or, for that matter, if he picks up the occasional 75M phone band QSO, it could be leading his vernacular in that direction as well lol.

Pit bull, try to keep it professional on list as we have nearly 3000 members from all parts of the world.
dropping the F bomb and using other shall we say curse words or graphically descriptive language is going to offend some and lessen the impact of what you have to say.
It's ok for "pitbull" the artist to swear and say that kind of stuff in his songs on public radio, but it isn't necesarily going to be acceptable on an email list :)

Well with Linux you have discovery time and effort.
Sometime configuration time.
BUT it doesn't compare to the time required to fix a health windows system or the time required for an unhealthy windows system.
And you learn something on the way. like no viruses. and open source software...

Pete

That's all fine until you grab an industry standard accounting software of the shelf (retail). You can then forget all about linux. Most software I use will not work on a linux platform even with WINE.

On another note you are open to viruses if you have WINE installed.

do you have a multi-meter with which you can check the contacts on the
charger itself?
Just to see if anything is actually coming out of them to charge the
battery.
might be a simple fix.
Open up the charger and see if you can detect any bad solder joints or
mechanical failures that might be easily fixed.
Otherwise, I'm sure 888 will replace the charger free of charge...most of
the sellers are pretty good about replacing bad pieces.
Obviously the wallwart is working otherwise you wouldn't see any LED's
coming on.

Try leaving radio in charger for a few minutes. Then remove and put back in. I find this works for me sometimes.

Pit Bull

No 2M in Tasmania? Nothing could be further from the truth. Not only are there plenty of 2M repeaters in Tasmania but many of them are linked, including links to some on 70cm. In fact, we have a fairly unique situation of being able to have handheld radio communication across most of the State (for those of you living elsewhere, Tasmania has a land mass almost the same size as metropolitan France and a climate similar to Spain and we spreak english.)

Among the radios I use to access that repeater network are my UV-5R and two UV-3R. If you cant get yours to work on our repeaters then you simply have programming problems.

From your posts to the group to date, I would really recommend that consider joining an amateur radio club where you will be able to get on-the-ground advice and assistance. In Hobart you have one of the best clubs in the entire country - REAST. Please look up www.reast.asn.au and go from there. I'm at Powranna, 2 hours up the Midland Highway, so I'm a bit distant to offer face-to face assistance. Do you a working copy of the software and cable installed?

Bill

On 22/09/2012 9:18 AM, Pit Bull wrote:
> Dont bother trying to get 2M on a UV-5R in Tasmania cause it cant be done and theres no repeaters around either so its only useful for simplex on VHF and UHF seems to be fine

Radioshop888 did not respond. As I said before, they said they would take care of it, but didn't.

I am not asking for repair tips, just informing the group of the experience.

The charger I got from radioshop888 does the same thing....
To get the charger to work I unplug the cord on the back of
the charger, put the battery in the charger then plug it in.
You don't need to take the wall-wart out of the AC plug just
unplug the DC cord going into the charger base. Irritating but
it does work.

A little bit of all that, Txema but predominantly Meditteranean. We also have a mountainous spine and western part, with another mountain chain in the north-east. High rainfall and snow is common in those parts, because of their elevation - we make good use of the accessible mountains as repeater sites. Our east coast is generally warmer than the rest, due to a warm current off-shore. Our north-west coast is also rainy and temperate.

Our proximity to the Antarctic continent can bring sudden changes in temperature, with blizzard-like conditions.

I live on a plain between the western and eastern mountains, quite dry but often windy. Hot in summer and very cold and frosty in winter. Probably as close to contintental as we can offer.

I have the mountains hosting repeaters in full view both to the west and east.

This was on the Novice exam when I took the test.

The formula is 234/f in MHz, add 5% for the radials.

> It doesn't take much.

I have two UV-5Rs. The first one is red, and came with the standard 1800 mah battery, and has the China Girl voice. Also, the volume will turn low, but not all the way down. I obtained a 3600 mah battery, in the matching red, and had no trouble snapping it into place.

I liked that so much, I ordered a second UV-5R in black, this one with the 3600 mah battery only. No 1800 mah. This one has the American English voice and the volume will turn all the way down. The 3600 mah battery also fits this radio correctly.

But wait! There's more! The batteries also interchange with no problem.

A few days after we experienced Hurricane Isaac, and by the way, we (another club member and I) made good use of the UV-5Rs during the hurricane -- for a few hours I worked as the club station through our local repeater from my home office with one of my UV-5Rs and the small battery, while topping off both large batteries as backup, until I could drive over and start the generator there -- so I ordered two additional 3600 mah batteries. These, too, snap in smoothly onto both UV-5Rs.

So, no problems with mine.

I would suggest test fitting by slipping thin strips of paper here and there, attempting to push on the battery, and seeing just where drag is felt when pulling out the strip of paper, to determine just where to file.

Very interesting Bill. I don't know why but since I was a kid Tasmania invoke a land full of mystery to me... Maybe because the name and distance. But I never could imagine it having a Mediterranean climate having on mind how far Tasmania and the Mediterranean sea are.

Today I learned something new and interesting.

Have a nice day Bill!!!

8429. Software Issue

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-22 02:35:51 UTC
From: n8oqy
Topic: 8429 Message: 8429

Hi all

I just received my radio this week. The problem that I'm having is that I am unable to program the radio with either the OEM software or CHIRP. I have read everything on this site concerning programming software issues. I have downloaded tried and installed all of the drivers at different times of course without any success. I am running windows seven professional 64 bit version.

I've check device manager and there are no conflicts with any COM ports. According to Windows all the drivers are fine. I have also made sure that the data cable itself is completely plugged in the radio per the advice of this website. The error that I'm getting with the OEM software says "failed to connect with the transceiver". The error I'm getting when using the CHIRP software says "an error has occurred:radio did not respond".

I went directly to the prolific website to further research the issue and make sure that I had the proper drivers. I downloaded and installed the prolific utility that checks the chip inside the data cable. The check came back with no errors and reported that I have a PL-2303 HXD Chip. does anyone have any advice on what I should do next? I would appreciate any help. Thank you.

hey bob:
there is very little, if any difference among the various UV5Rx models shall we call them. Based on a bunch of postings to this group in the last week or two, it seems as though they are all pretty much the same radio, with slightly different retailer/seller branding or additional letters or numbers tacked on.
This radio is selling like hotcakes, and so sellers are, I suspect, beginning to put extra letters on the model number to make people believe they are buying the latest and greatest unit compared to what other sellers have to offer...when in reality, it's the same radio.
I believe, again, based on postings from this group, that it is nothing more than a marketting ploy.
Of course, this kind of thing will make it a bit harder to determine when a true upgraded product comes out.
Perhaps baofeng is aware of this and will use a different model number to indicate any major upgrades to the firmware or hardware.

All this said, the UV5R plus, I think it is, seems to offer a slightly different case with a metal plate at the top instead of a plastic one...
Others can correct me if I'm wrong.

Also Marc, there are some silly things that go on with this "smart" charger. We would appreciate it if you would try a few of the hints that folks have given as we all can learn from the results.

At least one person claims that he had the same problem and the solution was to insert the radio/battery into the charger THEN plug it in? If you tried this and it does or does not work we would like to know that.

Thanks for your help.

Well, it has its mysteries, Txema. Particularly its fauna and flora.
Being in the southern hemisphere it is early spring here. Temperature at
the moment is 20.2C but snow is forecast for the highlands again
tomorrow.It had been raining all week until today, which of course would
have been tomorrow for you a couple of hours back.

Come down and visit sometime.

Anyone have a recommendation for a mini, short, female SMA antenna ?

I know they do mot perform well but I use them when working close to a repeater or other close in operations.

8443. Is uv-5r Plus CHIRP compatible?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-22 04:50:54 UTC
From: ttgs
Topic: 8443 Message: 8443

Hello All,
I am considering purchase of uv-5r PLUS from ebay vendor nicheone. I just wanted to be sure I will be able to use the CHIRP software to program it. Somewhere on the net I read that CHIRP will not work with the PLUS version. Is there any truth to that? I will be ordering the USB cable and driver with the radio together. Anyone have any input on the matter?
Thank you.

8446. Awesome ! :-)

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: w2eec
Topic: 8446 Message: 8446

I just received my UV-5RC From Import Communications.
Very fast shipping from NC to upstate NY.
I have seen the other UV-5Rs listed on Ebay and they were good looking but I must say that the redesigned body of the UV-5RC is sharp IMHO. I like it very much. The battery fist nicely and all the buttons are very comfortable to push.
As far as the programing goes, I can't get my USB cables to work. I have tried two and both won't work! I have installed all the drivers I could find. Prolific and FTDI with no luck. I am almost hopeless at this point. When I plug in the cable I see in the list the drivers available to use. Could be both cables are bad? I don't know. I forgot to say that I am using a Mac with OSX 10.8.2. This is when I remembered that I have a Keyspan USB to DB-9 converter that I know works so I am going to order a programing cable with the DB-9 end so I can use Chirp :-) Yes. I can boot in to windows and do the programing there but I want to keep things simple and just stay in OSX when ever possible. I am hoping the DB-9 Cable will work. It should because it worked on my Yaesu 897D for programing.
On to hand programing.
It is more easy than I thought. It is a system that once you learn it is quite easy but a lot of steps. Till I get a programing cable I programed in by hand all my 2M repeaters in my area. 32 of them. Only took a few hours while watching TV.
From what I noticed with the way you program from what is showed on the quick programing cards I got off of Import Communications page and from www.miklor.com/uv5r/. You don't need to program the offset or the shift because you are putting in the TX and RX frequencies. I tried programing a few frequencies with the shift and offset and it worked but I got much better reports not using them. As they say, whatever works.
I am going to order a few extra accessories this pay day. I would like to try the larger battery, Nagoya 771 and 701 antennas and see what I like. (I have always used Nagoya.) I also need the DB-9 cable and I was thinking about the battery eliminator but I have seen something about others having trouble with them. I'll have to check the posts. While looking around I also found some batteries that use 6 AAA in them. Good back up in a pinch if you ask me. I always have AAs and AAAs around.
My experience so far has been very good. I am thinking that I like it so much I may get another one for work and if I have the cash I may just get one for our club to try or have a drawing for. The last time we had a drawing for a new HT was the Wouxuns and after that it seemed like almost everyone in our club got one. I would have to say that with the UV-5Rs coasting about half the price of the Wouxuns from back then, you'll probably see most of our club members get one of these too. I think the'll be happy.
The only one accessory I wish Baofeng would come out with is a charging cable that plugs directly in to the HT its self. It shows one on page 4 of the manual with a Kenwood/Wouxun style plug on it. I would rather have that than have to get another charging base with a cigaret style plug on it and keep it in my truck. That is a lot more bulkier than just having a cable :-)
Originally I was going to shell out the cash for a Yaesu FT-60R but I am getting a lot more bang for my buck with the UV-5R IMHO. All the basic stuff I need to do can be done with this HT for about a third the price of the FT-60R.
I only have one complaint about this HT and a lot of others that come from China. I don't think I have ever had a use nor will I ever have the use for the alarm feature. I have

never had any friends that I know of ever use it either. I have however had the pleasure of seeing people accidentally triggering it then get frustrated trying to figure out how to turn it off. Not a big thing but in my opinion almost useless. It happened to me on my UV-3R I have at work. I went to push the PTT and hit the wrong button. Surprised the heck out of me when it happened :-) A few choice words may have come out of my mouth before I just took out the battery. Then I went to the manual to see how to turn it off just in case it happens again.
All in all I am very happy with my purchase and happy with Import Communications. They also have a new dual band/dual receive mobile rig coming out soon. I am going to be spending a lot of money with them :-)

I thought it might have been a case of confusing Tasmania with Tanzania
- but then later I thought it might have been a reference to Fawlty Towers.

The 'Plus' version is the same radio with a different look. Most 'new' UV-5R's are. Only the EE version with its extended frequency range is slightly different. Chirp will work with all versions.

Read in one of the feedback that UV-5RUU is not compatible with Chirp.

Who else face the same problems?

If you have a programming cable with a counterfeit chip, Windows Vista/7 must be using a driver version that is equal to or older than v3.2.0.0. This driver will work with a genuine chip as well so I would always start there. Device manager will display which driver version is installed. It sounds like you've already confirmed this, though.

So if the Prolific cable shows up in Device Manager without an "!" and the cable is plugged into the HT fully, which it sounds like you've already confirmed this as well, then I'd likely be suspecting the programming cable. Many have reported a poor soldering job on the radio end of the USB to RS-232 circuit board (there is a picture in the files area). A warm connector on the USB end of the cable has been reported by some with defective programming cables.

One other thing it could be, and it was eluded to by Marc, is that UV-5R HTs with the latest firmware, BFB-291, might not be compatible with either CHIRP or the OEM programming software.

When I went to pull up Diamond's site to check authorized retailers, I came across two sites:

Japan: http://www.diamond-ant.co.jp/english/
USA: http://www.diamondantenna.net

I'm assuming the US site is their authorized importer? Or is that actually a US branch for Diamond?

What version is the firmware?
Go to post #8449, If you have BFB 291, both oem and CHIRP software will not detect radio. I have contact 409shop CS and they gave me the "VIP" software but it just not work.
I am sure the problem is not on the cable. With the same cable, same software and same PC, the software read my BFB251 UV5R with no prob
lem. I try this with my other UV5R 291 and 251 firmware.
So my conclusion: they should update the software so It could detect BFB291 version of UV5R.

Hi All,

I have e-mailed the Baofeng Factory today with a request for information to determine the need for different software for the BF 291 versions.

I have had good luck "talking" with them in the past hopefully I will get an answer in a day or two.

I also requested that they update their manual online since there have been many changes from the start of production.

Meanwhile, those of you with the new units we need more than "It does not read or work or some such". Please do some detective work and flood the Group with DETAILS.

If anybody with a new unit has been successful we need to know that also.

JL

Eric,

Nice write-up.

I am seeing several reports that UV-5R HTs with BFB-291 firmware cannot be programmed with a programming cable. I'm not convinced it is a software issue yet, but for whatever reason, this may be you issue as well.

Here's the deal on menu 25 (SFT-D) and menu 26 (OFFSET)...

SFT-D and OFFSET must be set correctly to communicate through a repeater in Frequency Mode.

SFT-D and OFFSET are completely ignored when programming channels using the key pad. Only the entered RX and TX frequencies matter. SFT-D and OFFSET can be set to OFF/00.000 respectively (or even incorrectly) and you can successfully program channels all day long.

That being said, SFT-D and OFFSET are highly useful when programming repeater channels with the key pad. With SFT-D and OFFSET set to match the requirements of the intended repeater, you can store the displayed RX frequency into the channel you are programming. Then you can tap the [*/SCAN] key to put the UV-5R in reverse mode which conveniently displays the correct TX frequency. That frequency can then be stored into the same channel.

Enjoy the UV-5R.

Jim KC9HI

>
> I just received my UV-5RC From Import Communications.
> Very fast shipping from NC to upstate NY.
> I have seen the other UV-5Rs listed on Ebay and they were good looking but I must say that the redesigned body of the UV-5RC is sharp IMHO. I like it very much. The battery fist nicely and all the buttons are very comfortable to push.
> As far as the programing goes, I can't get my USB cables to work. I have tried two and both won't work! I have installed all the drivers I could find. Prolific and FTDI with no luck. I am almost hopeless at this point. When I plug in the cable I see in the list the drivers available to use. Could be both cables are bad? I don't know. I forgot to say that I am using a Mac with OSX 10.8.2. This is when I remembered that I have a Keyspan USB to DB-9 converter that I know works so I am going to order a programing cable with the DB-9 end so I can use Chirp :-) Yes. I can boot in to windows and do the programing there but I want to keep things simple and just stay in OSX when ever possible. I am hoping the DB-9 Cable will work. It should because it worked on my Yaesu 897D for programing.
> On to hand programing.
> It is more easy than I thought. It is a system that once you learn it is quite easy but a lot of steps. Till I get a programing cable I programed in by hand all my 2M repeaters in my area. 32 of them. Only took a few hours while watching TV.
> From what I noticed with the way you program from what is showed on the quick programing

cards I got off of Import Communications page and from www.miklor.com/uv5r/. You don't need to program the offset or the shift because you are putting in the TX and RX frequencies. I tried programing a few frequencies with the shift and offset and it worked but I got much better reports not using them. As they say, whatever works.
> I am going to order a few extra accessories this pay day. I would like to try the larger battery, Nagoya 771 and 701 antennas and see what I like. (I have always used Nagoya.) I also need the DB-9 cable and I was thinking about the battery eliminator but I have seen something about others having trouble with them. I'll have to check the posts. While looking around I also found some batteries that use 6 AAA in them. Good back up in a pinch if you ask me. I always have AAs and AAAs around.
> My experience so far has been very good. I am thinking that I like it so much I may get another one for work and if I have the cash I may just get one for our club to try or have a drawing for. The last time we had a drawing for a new HT was the Wouxuns and after that it seemed like almost everyone in our club got one. I would have to say that with the UV-5Rs coasting about half the price of the Wouxuns from back then, you'll probably see most of our club members get one of these too. I think the'll be happy.
> The only one accessory I wish Baofeng would come out with is a charging cable that plugs directly in to the HT its self. It shows one on page 4 of the manual with a Kenwood/Wouxun style plug on it. I would rather have that than have to get another charging base with a cigaret style plug on it and keep it in my truck. That is a lot more bulkier than just having a cable :-)
> Originally I was going to shell out the cash for a Yaesu FT-60R but I am getting a lot more bang for my buck with the UV-5R IMHO. All the basic stuff I need to do can be done with this HT for about a third the price of the FT-60R.
> I only have one complaint about this HT and a lot of others that come from China. I don't think I have ever had a use nor will I ever have the use for the alarm feature. I have never had any friends that I know of ever use it either. I have however had the pleasure of seeing people accidentally triggering it then get frustrated trying to figure out how to turn it off. Not a big thing but in my opinion almost useless. It happened to me on my UV-3R I have at work. I went to push the PTT and hit the wrong button. Surprised the heck out of me when it happened :-) A few choice words may have come out of my mouth before I just took out the battery. Then I went to the manual to see how to turn it off just in case it happens again.
> All in all I am very happy with my purchase and happy with Import Communications. They also have a new dual band/dual receive mobile rig coming out soon. I am going to be spending a lot of money with them :-)

Hi,
I also emailed them about not being able to program with software.
Mine is also the BF 291 version.
The pc and radio will not communicate with each other.
I thought the jacks might have been contaminated so I plugged the cable in several times.
I can program earlier versions of the UV-5R with the same software and serial cable.

Thanks for doing this, John. I'm not yet convinced this is a software issue and it would be nice to know directly from Baofeng.

I could be wrong, but the reason I feel this might not be a software issue is because I believe Baofeng would have pushed out a supporting version of software on their web site. The versions currently available were posted April 29, 2012 (v12.03.06 which is what I use).

I'm wondering if maybe there isn't a connector issue or a wiring error in the UV-5R related to the BFB-291 firmware. Has anyone in the group with any model of UV-5R sporting the BFB-291 firmware been able to successfully use a speaker mic with it?

Thanks,
Jim KC9HI

Jim,

That was my first real thought also but I wanted to get a confirmation from the factory and in doing that alert them to the issues. It is fun to try to solve some of this but sometmes the manufacturer needs to be brought in to the mix.

Sometimes this all reminds me of when my wife gets to pushing buttons on the remotes and she can't get back to square one. Usually she will say something like " I've pushed all the buttons and tried everything..... it's broken". After frustration sets in, logic seems to fade.

Jim.
Thanks for the info.
I did notice that menu 25 and 26 did work in VFO mode but not in memory mode. I forgot to mention that. I plan on using memory mode 99% of the time. I think the only time I really have used VFO mode is to program and simplex. I just wish that 25 and 26 would work for memory mode so that it would show the direction of the offset (-) or (+) rather than just (+-) . Just a pet peeve. I can always use the star key to see the reverse to figure out the direction. Nothing big :-)
As far as the firmware goes, I have (3) BFB281 (6) 120724A Ver-05.
I am thinking that I could have the counterfeit USB cables. I believe older drivers did work with them. I have the newest drivers in now. I noticed that when I used each cable, in the drop down list named "Port" it would show the correct driver for the cable but wouldn't work. I know this Keyspan USB to DB-9 serial works so I'll be able to test it to see if the firmware accepts the programing. I'll let you know if it works once I get the DB-9 Programing cable.
Quick question for you.
I also would like to program in some of my local FDs and police frequencies but would like to make it so there was no chance to transmit. Has anyone figured that one out yet?
I was thinking of just trying to save to memory the receive and seeing if that works. I have not really had a chance to play with Chirp but that may have a way to do it I am hoping.
Have a good day.

8480. Homebrew Programming Cable - Part I

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-22 19:29:54 UTC
From: Jim
Topic: 8480 Message: 8480

I've been waiting for the weekend to arrive so I could make time to mess around with this project. I am still waiting on another component to arrive and I was going to wait until it arrived before I was going to reveal what I've been working on. But since today's experimentation went so well, I decided to do this in two parts.

Note: The software portion of this post is specific to Windows. There are drivers for Mac and Linux operating systems, so this should work for them as well. I just can't help you with that part of it.

The goals for making my homebrew programming cable were...
- use easily obtainable parts so the project could be duplicated by others
- keep the cost low

The components:

The main component is a USB 2.0 to TTL UART 6PIN CP2102 Module Serial Converter. It was purchased from an eBay seller called E_goto for $2.39 including shipping. Search using "CP2102" and you should easily find it.

The next component needed is the wire/cable that goes from the serial converter to the radio. In my case I used a 3-conductor wire from an old computer that had female Dupont connectors on one end and a reset switch on the other. I just unsoldered the wires from the switch and I was all set. For those not lucky enough to have a junk box with a cable like that in it, the serial converter module that I bought came with an 8" long 7-wire cable with female Dupont connectors on both ends. Just carefully separate 3 wires from the group and clip, strip and tin one end.

The remaining components are the 3.5MM (1/8") stereo phone plug and the 2.5MM {3/32"} stereo phone plug. I got (2) 3.5MM and (3) 2.5MM from an eBay vendor for $6.13 making them roughly $1.23 each.

So the component cost was roughly...

$2.39 serial converter module
$FREE cable
$1.23 3.5MM stereo phone plug
$1.23 2.5MM stereo phone plug
=====
$4.85 total cost of parts including shipping

Soldering the wires to the phone plugs is the most difficult part of the project. Note: don't forget to 'thread' the wire(s) through each plug's shell before soldering.

Here is how the wires get attached.

The TXD line from the module goes to the sleeve of the 3.5MM plug.

The RXD line from the module goes to the ring of the 2.5MM plug.

The GND line from the module goes to the sleeve of the 2.5MM plug.

Screw each plugs into its respective shell. We are almost ready for the 'smoke test'.

Unless you've used a CP210X device in your computer before, you will probably need to install a driver. The driver comes from Silicon Labs and supports Windows XP/Server 2003/Vista/7. Here's the URL

http://www.silabs.com/products/mcu/Pages/USBtoUARTBridgeVCPDrivers.aspx

After double clicking on the downloaded software, it seemed to unpack itself and after a few seconds asked if I wanted to install the driver. I confirmed that I did and the driver was then installed.

Now plug the cable onto the serial converter making sure that each wire is pushed onto the correct pin. Now plug the serial converter into a USB plug on your computer. You should see the "installing driver" balloon popup and eventually "success" should be reported.

Use Device Manager or FindComPort.exe to determine the COM port that was assigned to the DIY programming cable. If the COM port number is higher than 8 and you intend to use this with the OEM software, you will have to read message 1476 or download "Message 1476.txt" in the "Programming cable and drivers" folder of the files area for advice on changing it to a lower COM port number.

Now plug the cable into the UV-5R. This is where I learned to appreciate why other must make sure that the plug if fully engaged with the socket (it is easy to think it is when it isn't). Turn on the UV-5R and program away.

I forgot to mention that pictures of the completed cable itself and while being used have been uploaded to the "Homebrew Programming Cable-Part 1" photo album.

Easy...

With the OEM software just delete the TX frequency and leave it blank to inhibit transmit on a channel.

With CHIRP set Duplex to "off" for the same result as above.

Colin,

I'm pretty sure I overheard a Mac user say "I like my stuff to work all the time, so I use OS X. Microsoft still has too many growing pain issues for me to be completely comfortable using their software and hardware." Wait a minute, it might have been a Linux user...

To be fair, many of these types of spams are not from the individual's computer being infected with a virus, but because their web based email account got hacked. Note that this original poster is coming from Yahoo mail

The evil spammers can then send messages to that person's friends and email list, appearing to come from them. This will trick the unwary into clicking on the link, which will bring them digital grief.

Best defense is to change the password on the web based email right away, and use complex passwords that are harder to guess.

Subject: [baofeng_uv5r] Homebrew Programming Cable - Part I

I've been waiting for the weekend to arrive so I could make time to mess around with this project. I am still waiting on another component to arrive and I was going to wait until it arrived before I was going to reveal what I've been working on. But since today's experimentation went so well, I decided to do this in two parts.

Note: The software portion of this post is specific to Windows. There are drivers for Mac and Linux operating systems, so this should work for them as well. I just can't help you with that part of it.

The goals for making my homebrew programming cable were...
- use easily obtainable parts so the project could be duplicated by others
- keep the cost low

The components:

The main component is a USB 2.0 to TTL UART 6PIN CP2102 Module Serial Converter. It was purchased from an eBay seller called E_goto for $2.39 including shipping. Search using "CP2102" and you should easily find it.

The next component needed is the wire/cable that goes from the serial converter to the radio. In my case I used a 3-conductor wire from an old computer that had female Dupont connectors on one end and a reset switch on the other. I just unsoldered the wires from the switch and I was all set. For those not lucky enough to have a junk box with a cable like that in it, the serial converter module that I bought came with an 8" long 7-wire cable with female Dupont connectors on both ends. Just carefully separate 3 wires from the group and clip, strip and tin one end.

The remaining components are the 3.5MM (1/8") stereo phone plug and the 2.5MM {3/32"} stereo phone plug. I got (2) 3.5MM and (3) 2.5MM from an eBay vendor for $6.13 making them roughly $1.23 each.

So the component cost was roughly...

$2.39 serial converter module
$FREE cable

$1.23 3.5MM stereo phone plug
$1.23 2.5MM stereo phone plug
=====
$4.85 total cost of parts including shipping

Soldering the wires to the phone plugs is the most difficult part of the project. Note: don't forget to 'thread' the wire(s) through each plug's shell before soldering.

Here is how the wires get attached.

The TXD line from the module goes to the sleeve of the 3.5MM plug.

The RXD line from the module goes to the ring of the 2.5MM plug.

The GND line from the module goes to the sleeve of the 2.5MM plug.

Screw each plugs into its respective shell. We are almost ready for the 'smoke test'.

Unless you've used a CP210X device in your computer before, you will probably need to install a driver. The driver comes from Silicon Labs and supports Windows XP/Server 2003/Vista/7. Here's the URL

http://www.silabs.com/products/mcu/Pages/USBtoUARTBridgeVCPDrivers.aspx

After double clicking on the downloaded software, it seemed to unpack itself and after a few seconds asked if I wanted to install the driver. I confirmed that I did and the driver was then installed.

Now plug the cable onto the serial converter making sure that each wire is pushed onto the correct pin. Now plug the serial converter into a USB plug on your computer. You should see the "installing driver" balloon popup and eventually "success" should be reported.

Use Device Manager or FindComPort.exe to determine the COM port that was assigned to the DIY programming cable. If the COM port number is higher than 8 and you intend to use this with the OEM software, you will have to read message 1476 or download "Message 1476.txt" in the "Programming cable and drivers" folder of the files area for advice on changing it to a lower COM port number.

Now plug the cable into the UV-5R. This is where I learned to appreciate why other must make sure that the plug if fully engaged with the socket (it is easy to think it is when it isn't). Turn on the UV-5R and program away.

Well, just curious! I did open that thing but didn't log on to their site. It looked like it wanted to enhance my interest because the featured story indicated that the "getting rich fast stay at home mother" lives in Parkville, Maryland. Wonder if opened by a person living elsewhere would get a different location? That could be an indication of whether the thing is Spam. I did see something similar a few weeks back but don't remember if it contained where I live.

I FINALLY got onto a repeater yesterday at Mt Faulkner but the 2M and 70cm repeater at gagebrook is a issue considering I'm in bridgewater and does anyone know how much a amateur radio licence in Australia,WHat I've found is some crap saying it can cost like $10 and the I found something saying it could cost $700 a year and they work out the cost in dividing the frequency by something and it could cost for a example 10c per 1KHz and theres nothing on course cost,location or anything which is rather useless

All your questions can be answered here http://www.wia.org.au/

The 2m/70cm repeaters might also require CTCSS tones to access. If you are without a amateur radio licence you not be allowed to access the repeaters because with each transmission you are required to identify yourself with callsign. Perhaps you are referring to UHFCB repeaters. All information here http://www.uhfcb.com.au/

Hello all.

Despite rumors of my demise... :)

I have received several offers for sub-moderation and will probably agree that this is a good idea. I do remove quite a bit of spam, and that probably goes unnoticed, which is a good thing.

I do read the group often but it probably is every other day or so.

Occasionally, we will get hit by some type of spam. Most of you know not to go clicking on random links of a post with little or no content. For the others, please remember :-) We are all at different levels of experience.

The good news is I have had to remove few users and few messages during our busy start up. If you notice, there are lots of congenial notes to other members and few flare-ups. You'll also notice most things solve themselves pretty rapidly because most hams are respectful and thoughtful. But in any large group, we will have a few.

Enjoy your radios...

8497. VHF Marine Channels And Weather

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-22 21:38:34 UTC
From: Pit Bull
Topic: 8497 Message: 8497

Has anyone is australia tryed to use the UV-5R as a marine radio and if so did it work and how can you get the weather channel on it thats 445.000MHz cause I cant pick it up and the weather forecast would be useful and especially on VHF

Bill,

Glad to hear that you are OK (knew you were).

Thanks for all you do, this has turned into one of the very best Groups I've been a part of in my short 40+ years of working with computers and PEOPLE.

Take care,

John

Subject: [baofeng_uv5r] Re: Is the founder of this group still alive?

Hello all.

Despite rumors of my demise... :)

I have received several offers for sub-moderation and will probably agree that this is a good idea. I do remove quite a bit of spam, and that probably goes unnoticed, which is a good thing.

I do read the group often but it probably is every other day or so.

Occasionally, we will get hit by some type of spam. Most of you know not to go clicking on random links of a post with little or no content. For the others, please remember :-) We are all at different levels of experience.

The good news is I have had to remove few users and few messages during our busy start up. If you notice, there are lots of congenial notes to other members and few flare-ups. You'll also notice most things solve themselves pretty rapidly because most hams are respectful and thoughtful. But in any large group, we will have a few.

Enjoy your radios...

Topic: 8429 Message: 8499

You can get a Prolific IC in a cable to program the UV-5R for less than $15 and I found that the programming cable is on Com 3,Pity they wont cut out all the crap and just make a USB programmable version where you just plug in a micro USB plug into the radio just like a mobile phone and or like a 20KB flash drive and it saves a file as a .inf or .dat and just reads that to program itself

> > If you have a programming cable with a counterfeit chip, Windows Vista/7 must be using a driver version that is equal to or older than v3.2.0.0. This driver will work with a genuine chip as well so I would always start there. Device manager will display which driver version is installed. It sounds like you've already confirmed this, though.
> >
> > So if the Prolific cable shows up in Device Manager without an "!" and the cable is plugged into the HT fully, which it sounds like you've already confirmed this as well, then I'd likely be suspecting the programming cable. Many have reported a poor soldering job on the radio end of the USB to RS-232 circuit board (there is a picture in the files area). A warm connector on the USB end of the cable has been reported by some with defective programming cables.
> >
> > One other thing it could be, and it was eluded to by Marc, is that UV-5R HTs with the latest firmware, BFB-291, might not be compatible with either CHIRP or the OEM programming software.

I can tell you what suprisingly works for me. I have a Wouxun and programmed it with a driver downloaded from the Wouxun US website. Low and behold, when I plugged the programming cable into the Baofeng, it worked perfectly. I did download the software from danplanet and then one of the daily builds first. I am using XP. I have 3 USB cables and they all work. The most recent one was obtained thru eBay from a seller named "nicheone" for $5.99 shipped. Remember if you get one working, stay with the same USB port on the computer. Maybe this will help some of you. The Baofeng was a recent purchase through Amazon.

Pit Bull,

The battery has two terminals that connect to the UV-5R, one closese to the PTT side is - and the other is +.

The battery has three terminals that connect to the charging base, they are marked +, T and - (the T (center) terminal is not used).

The Baofeng website is http://powerphone.com.cn/en/index.asp

Something else that you might be interested in would be the TYT TH-UVF9 battery (409shop item ID: 2-053). It has a DC in jack on the side of the battery. My understanding is that this battery fits right on a UV-5R (can anyone in the group confirm this?). It has no contacts in the back so it won't work in the charging base. The TYT radio includes both a wall wart home charger and a 12V automotive charger in the package but I would imagine that they are available separately as well.

Yup, they're the same on both ends.

Just thinking out loud here, I would rather buy one that fits for $12.95 and spend the time saved studying for my Ham license.

If you were thinking about one for the house then I would make a 110?v/12v thingy with a power adapter outlet and just plug the purchased unit in to that. In fact stateside we can buy that too for just a few bucks.

Jim,

Thanks for the writeup. My cable died the other day and I was looking at options to avoid buying another problem-child fake chip USB cable.
During my troubleshooting, I disassembled it and rang out the wires. The TX and RX on my cable are opposite of what you describe (TX goes to the 2.5mm plug). Is this something specific to the chip you used or is my cable wired/labeled incorrectly? My cable did allow me to load the radio several times before it gave up the ghost. Now, the computer doesn't recognize it. Tried it on multiple computers running different OS's, so its not a puter issue.

73,
Bob

From: Pit Bull
Topic: 8510 Message: 8510

IF anyone is interested Inport Communications have a nice looking mobile radio and considering its only $275 it looks good and should work pretty good for the price aswell,but what I cant understand is the need for soo much power output considering theres repeaters
But then if your out at sea well that different though

AnyTone AT-588UV Features:

Receive Range (FM) 134-174, 200-260, 350-400, 400-520 MHz & FM Broadcast
(AM) 118-134 MHz (Air Band)

Transmit Range (FM) 134-174, 400-490 MHz

Output Power 50, 35, 10 & 5 Watts

Bandwidth Wide (25 kHz) & Narrow (12.5 kHz)

Tuning Step 2.5, 5, 6.25, 10, 12.5, 15, 20, 25 & 50 kHz

True Dual Receive - receive two signals at the same time or second side can be muted while transmitting

Separate Tuning Knob and Volume Control, each side

Separate Function Buttons, each side

Either side can be VHF or UHF at any time - VU, UV, UU, VV

Cross-Band Repeat (that works!)

Alphanumeric Display

4 x 256 Memory Channels

CTCSS, DCS, DTMF, ANI, PTT ID, 2Tone/5Tone Encode & Decode

Scrambler Option

DTMF Microphone

Detachable Control Head (CAT5 separation cable)

Computer Programmable

FCC Part 90 Certified

Hello all, Name here is Walter or Wally for short KD5ZJP.

My new Boefeng UV-5R just got delivered at home and is waiting for me. Got 2 more hours before I get off work to go home and play.

Never owned one of these radios but saw one on Amazon for $49 bucks after shipping and had to pick one up. Most of the reviews I have seen are good. I figured for less than $50 could not be to much of a waste.

I look forward to being part of the group.

8514. Field Programming Question

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-23 00:54:29 UTC
From: E.Z. Pikens
Topic: 8514 Message: 8514

I just passed my Technician test and am trying to get a grip on purchasing my first radio.

It turns out that people have very strong opinions about hardware. I'm leaning toward a Boafeng but have a couple of questions based upon the strong advice I've gotten to buy a Yaesu or Kenwood.

I know nothing about HT's -- so these may be dumb questions but:

1. How hard is it to program a Baofeng "in the field"? By that I mean, on the fly without a computer. Using the keypad. I'm going to use mine for CERT work. What I've been told is that the "Chinese" radios are very difficult to program and can only really be programmed with a computer, while the Kenwoods and Yaesus are much easier? True?

2. That I cannot rely on the accessories I buy with the radio, from the people who sell the radio, to work with the radio. For example, they say the USB programming cables that are sold by the Baofeng suppliers often don't have a chip that is essential to programming. True?

3. That there is a big difference between the 4 watt Baofeng and the other brand's 5 watt radios. True?

Sorry if these questions are too elementary, but I've been doing a lot of reading and haven't figured them out.

Thanks for the help.

Steve

It was $66 per year last year but I expect that there will be some small increase this year. The amateur licence is a flat fee, regardless of licence class. Commercial licences have different fee structures, so I imagine that is what you came across in your research.

As to course fees and examination fees, I again suggest you get in touch with REAST in Hobart. They can advise you of course and examination availability, since they conduct both and are the only body in the south doing so. They could also guide you through the setup for the Gagebrook repeaters.

The other website you could check out is the national body, www.wia.org.au

Bill

Hi all,

Im also new to the group.

Got my uv5r last week & it seems great so far.

Still waiting for my cable however.

This looks like a very handy group to learn from.

Cheers.

There is NO 'best radio'. They all have features and warts. The UV-5r will transmit and receive as well as any and for the money is as good as you will find. I have a Wouxun KG-UVD1P (2 years), have had two UV-5Rs, have a 3R and a 3RPlus, and I use Motorolas, Kenwoods and Wouxuns at work, and all just work. You will not go wrong with a UV-5R- it will allow you to talk on VHF and UHF and to figure out what you really need for the long haul.

Welcome to the hobby!!!

If you read review of HT, and ham gear on general, you will see that there is always somebody complaining about how difficult the programing process is. But it was the same with old vhs video machines.

My previous HT's are Yaesu brand and lots of people complain about difficult programing, but I never had issues programing them.
Same thing with the uv-5r... Before I got it I read the web about the uv-5r, you can find the link on the forum's home page, and I was able to program the HT as soon as I had it on my hands. No rocket science here.

But it is true that is much more easy and convenient if you use the program cable, specialy if you want to program lots of frequencies.

I bought the uv-5r with the program cable all together, it worked at the first try I did. I'm using a computer with windows xp.

There is no much difference between 4w and 5w, nothing that make a different you ever will notice.

The uv-5r is not a perfect HT, but no one I ever had is perfect. It works, it has the work done as good as others of hundred the $. It is not submersible, it has not all the bells and whistles of the big bucks ones but I want my HT's for talking and listening, and doing that the uv-5r works great.

Txema, kj4ebe.

Subject: [baofeng_uv5r] Field Programming Question

I just passed my Technician test and am trying to get a grip on purchasing my first radio.

It turns out that people have very strong opinions about hardware. I'm leaning toward a Boafeng but have a couple of questions based upon the strong advice I've gotten to buy a Yaesu or Kenwood.

I know nothing about HT's -- so these may be dumb questions but:

1. How hard is it to program a Baofeng "in the field"? By that I mean, on the fly without a computer. Using the keypad. I'm going to use mine for CERT work. What I've been told is that the "Chinese" radios are very difficult to program and can only really be programmed

with a computer, while the Kenwoods and Yaesus are much easier? True?

2. That I cannot rely on the accessories I buy with the radio, from the people who sell the radio, to work with the radio. For example, they say the USB programming cables that are sold by the Baofeng suppliers often don't have a chip that is essential to programming. True?

3. That there is a big difference between the 4 watt Baofeng and the other brand's 5 watt radios. True?

Sorry if these questions are too elementary, but I've been doing a lot of reading and haven't figured them out.

Thanks for the help.

G'Day Pit Bull,

I wouldn't use the UV-5R as a VHF Marine radio as it is not type approved by the AMCA..

In other words if your caught with the radio and have VHF marine frequencies programmed into it, it's off to court you go.. (same goes for other type approved bands)

Cheers,

Rob.

Yes, the UV-5R is difficult to program manually, very difficult, if you go by the very inadequate manual supplied. There are some Youtube videos that show you how to program, and if you will follow them you will have success. DO NOT program in the receive tones, only the transmit tones.

As far as Yeasu or Kenwood being easier to program manually, whoever told you that must not have programmed them. They are equally confusing, even with their manuals. The UV-5R is no more difficult than the other brands.

> 2. That I cannot rely on the accessories I buy with the radio, from the people who sell the radio, to work with the radio. For example, they say the USB programming cables that are sold by the Baofeng suppliers often don't have a chip that is essential to programming. True?

There are problems with fake/clone/counterfeit Prolific chips... but these are the same problems that model railroaders, hams interfacing for digital modes, and others have with USB cables made in China. This is not unique to Baofeng.

> 3. That there is a big difference between the 4 watt Baofeng and the other brand's 5 watt radios. True?

No, there is not. That 4 w vs 5 w is insignificant. You will gain much more by changing to a better antenna. In fact, there is a $3.79 antenna (with FREE shipping) that is pretty darn good, and better than the stock antenna.

With VHF and UHF it is all line of sight. It is all antenna and height of the antenna (on a hilltop, overpass, other high ground vs. in a valley). Power is just not a big factor. 4 w vs. 5 w is not even 1 db difference.

I was working Pumpkin Patrol in a very remote area and still had to run a net. In this remote area I had to bump the power of my mobile rig up to 50 watts for this just to make it in to the repeater. Without the power this would not be possible. In my opinion it is always nice to have a little bit of head room as far as power goes. Also there are not a lot of repeaters at my camp and I need a lot of power just to make it in to a few of the repeaters along with a better antenna. I hope this helps answer your question.
The Any Tome is the rig I am looking at too.
I was looking at the Yaesu FT-8800r but this just may change my mind and I love the fact that it is $125 dollars cheeper :-)

I can tell you what suprisingly works for me. I have a Wouxun and programmed it with a driver downloaded from the Wouxun US website. Low and behold, when I plugged the programming cable into the Baofeng, it worked perfectly. I did download the software from danplanet and then one of the daily builds first. I am using XP. I have 3 USB cables and they all work. The most recent was obtained thru eBay from a seller named "nicheone" for $5.99 shipped. Remember if you get one working, stay with the same USB port on the computer. Maybe this will help some of you. The Baofeng was a recent purchase through Amazon.

Good Luck to all. Jim AF6EC

8527. Ham General License

I keep seeing messages encouraging new hams to go to the next step and get their General license. What real benefit does having a General license really have other than it looks good on paper?

I live in apartment, I have no way to put up outside antenna's. 2M & 70cm will serve me well as I can work them with an HT and/or mobile.

Don't get me wrong, I have nothing against getting a General license but what benefit does it give someone like myself?

The benefit of getting the General License is that you can use HF band with some frequencies restrictions. And getting the Extra License you can use HF bands without restrictions.

If your interest on Ham Radio is only on VHF and above there is not benefit on getting the General or Extra Licenses.

IF anyone is interested Inport Communications have a nice looking mobile radio and considering its only $275 it looks good and should work pretty good for the price aswell,but what I cant understand is the need for soo much power output considering theres repeaters

But then if your out at sea well that different though

AnyTone AT-588UV Features:

Receive Range (FM) 134-174, 200-260, 350-400, 400-520 MHz & FM Broadcast

(AM) 118-134 MHz (Air Band)

Transmit Range (FM) 134-174, 400-490 MHz

Output Power 50, 35, 10 & 5 Watts

Bandwidth Wide (25 kHz) & Narrow (12.5 kHz)

Tuning Step 2.5, 5, 6.25, 10, 12.5, 15, 20, 25 & 50 kHz

True Dual Receive - receive two signals at the same time or second side can be muted while transmitting

Separate Tuning Knob and Volume Control, each side

Separate Function Buttons, each side

Either side can be VHF or UHF at any time - VU, UV, UU, VV

Cross-Band Repeat (that works!)

Alphanumeric Display

4 x 256 Memory Channels

CTCSS, DCS, DTMF, ANI, PTT ID, 2Tone/5Tone Encode & Decode

Scrambler Option

DTMF Microphone

Detachable Control Head (CAT5 separation cable)

Computer Programmable

FCC Part 90 Certified

Steve,

Check out the Miklor.com site, it has a link to the $3.79 antenna which is a very, good antenna and cheap too.

Thanks to all of you for taking the time to answer.

Is there somewhere where I can find the exact accessory antenna to buy? I've done sme searches here -- but truth be told, I'm not great when I search Yahoo groups. I get a lot of "off topic" stuff.

And, yes, I am trying to keep the momentum going. Sat night and I'm studying for the General exam. I think I've found a place giving it next Sat.

Thanks, again.

Steve

Today you live in an apartment maybe next year you'll be in a tent with a HF radio. Just because you don't need the "ticket" now should not preclude your learning of additional facets of the hobby.

Subject: [baofeng_uv5r] Ham General License

I keep seeing messages encouraging new hams to go to the next step and get their General license. What real benefit does having a General license really have other than it looks good on paper?

I live in apartment, I have no way to put up outside antenna's. 2M & 70cm will serve me well as I can work them with an HT and/or mobile.

Don't get me wrong, I have nothing against getting a General license but what benefit does it give someone like myself?

You don't program an offset and you can not transfer a VFO to a duplex memory. You start by deleting the memory location you want to use, then you set all the parameters for the receiving memory and then you set all the parameters for the transmit memory. If you need a tone for transmit, set it before you program for the second pass. If you mess up, you can't change the receiving memory parameters without deleting the memory, but I've found you can reprogram the transmitting memory more then once, it will just overwrite the transmit memory.

There is noting wrong with being a Tech. If you are happy with the privileges that you have, then don't sweat it.

However...

The general class license gives you privileges on every amateur band.

You would be able to participate in field day, visit a club station or visit another ham and operate the 'low' band equipment without a control operator overseeing what you do.

It's not impossible to operate on the 'low' bands with an indoor antenna.

In a way, it's kind of like the motorcycle endorsement on my drivers license. I don't have a motorcycle, but if I ever get an opportunity to ride one, I can do it.

The General is the "most bang for the buck" ticket, and is not much more difficult than the Tech you just passed. If you can pass the Tech, you can pass the General with very little more study.

If you can't do HF in your apartment, you can participate in other places.

"I have no way to put up outside antenna's."

I'll bet you a cuppa coffee and a new dipole center insulator I could find a way. ;-)

Please visit Hamuniverse.com, and on the left click "Antenna Design". There are many practical, easy to build antennas there. Also, you can download this free antenna book.

http://www.hamuniverse.com/n4jaantennabook.pdf

I often go to a park with my portable HF rig, set up, and make contacts all over the USA, Canada, Mexico, Cuba, and the Carribean.

A great antenna for such work is a 66' overall length "Windom" (more properly an Offset Center Fed Dipole or OCFD), which will work 40, 20, 10, and 6 meters, and with a tuner will possibly do 15 and 17 meters. Don't buy one, make one. Use a 4:1 current balun, with 41' of wire on one side, 25' on the other. That, some parachute cord to hang it and tie off the ends, you can talk to the world.

Please go to the Files section, find and read "For the Wannabe or New Ham".

Don't limit yourself.

73,
Paul - AE5JU

It's a good thing this HT isn't made by Apple or Sony, because
then you'd have to buy their products to work with it.

You asked about antennas. I have both the Wouxun and the Baofeng. The antenna that comes with the Wouxun is superior to that which comes with the Baofeng

I decided to order an antenna from eBay member "esupermarket010" for $3.49. It was described as a "J0 125A female". When I received this antenna (pretty promptly from China) I was surprised to see it was the exact same antenna that is supplied with the Wouxun.

I have tried other antennas ie., Diamond RH951S, and found it to be no better that the J0 125A in actual field testing.

As far as programming goes, its just a matter of learning the radio. It is no more complex than any others from the big manufacturers.

Have fun with the UV-5R, it is a great little radio.

Found it I think.
Post #6415. It states:

Also note that some of the lower receive CTCSS tones, 100.0 Hz
included, will not scan on the UV-5R. Another reason not to program a receive
CTCSS tone unless you have to.

So I should have no problem scanning my programed frequencies just using the transmit CTCSS. Awesome :D
Let me know if I am incorrect. Thanks and have a good weekend all.

Just do what I recently did for my 27MHz SSB radio,get some cheap wire n make a long wire and the only insulators iI used was a connector block on 1 end and a fishing line spool on the other,Btw you will need a antenna tuner and if you want to make one its ALOT easier than UHF.....Or theres always the magnetic loop antenna if you can get all the parts to make it,But what I've seen the voltage can kill you if your not careful

There's a (new Yahoo!) group for that. Anytone_AT-588UV

I joined a couple of days ago. As of this writing there are 117 members. There's not a lot of activity yet but we've installed the programming software and have been playing around with it. I'm hoping that the Anytone_AT-588UV group will be an early source for breaking news.

Eric,
The problem is only with R-CTCSs frequencies of 136.5 Hz and lower.

the uv5R does narrow band no problem.
it also has 2.5KHZ step so you can easily program the narrow band freqs.

the J0125A is not precisely and exactly the same antenna as the wouxun.
The wouxun antenna is a bit shorter (perhaps a quarter of an inch), and has a slightly longer threaded shell on the female connecter.
It also has vertical embossed writing on two sides of the plastic above the base.
Beyond that, they are almost identical in build and look.

Subject: [baofeng_uv5r] Re: Field Programming Question

You asked about antennas. I have both the Wouxun and the Baofeng. The antenna that comes with the Wouxun is superior to that which comes with the Baofeng

I decided to order an antenna from eBay member "esupermarket010" for $3.49. It was described as a "J0 125A female". When I received this antenna (pretty promptly from China) I was surprised to see it was the exact same antenna that is supplied with the Wouxun.

I have tried other antennas ie., Diamond RH951S, and found it to be no better that the J0 125A in actual field testing.

As far as programming goes, its just a matter of learning the radio. It is no more complex than any others from the big manufacturers.

Have fun with the UV-5R, it is a great little radio.

Here is a blog that compares the $3.79 antenna to the the Wouxun and Quansheng antennas.

http://hamgear.wordpress.com/2012/07/10/the-3-79-antenna-review/

The $3.79 antenna is the one I currently use on my UV-5R.

let's not forget simplex operations where higher power is sometimes needed.
Repeaters aren't the only way to communicate on 2M and 70CM.
And, if you do any highway travel, it's nice to have 50 wattts to stay into the repeaters a bit longer, or just maintain a good arm chair copy signal for the other party.
Yes, we're supposed to use the least amount of power to communicate reliably, however, cummunicating reliably, and having a nice clean QSO are two very different things.
someone can have 80 per cent noise on their signal, and as long as you can hear their audio, you can communicate reliably. But if they are full quieting into your receiver, the conversation can be much nicer.
and 5 watts to 50 watts can and will make the difference between noisy and full quieting.

has anyone done an SWR sweep chart for this 3.79 antenna?
I will have one eventually, but the tech who has the equipment to create the digital print out of his results has been out of town since I bought the j0125As.
Another tech I know checked one of my antennas, but his results were not congruent with all the info I have read on this list about the antenna.
I may have gotten a non functioning antenna...so I'm going to have him check the one I've been using with great success for the past couple weeks...supperior to the stock antenna on VHF and UHF for sure from what i can tell.

Correct.

The bug was originally reported as being a problem at 100 Hz. But Cap KE6AFE some experimentation and reported the full extent of the bug(s) back in message 4637.

We mostly only talk about the part of the bug where scanning won't stop on programmed R-CTCSs frequencies 136.5 Hz and lower. The second part of the bug is that for programmed R-CTCSs frequencies 141.3 Hz and higher, scanning will stop and the squelch will be opened for _ANY_ CTCSS tone 141.3 Hz and higher!

Here's the URL to the post.

http://groups.yahoo.com/group/baofeng_uv5r/message/4637

Gotta run. I have a menu guide to update. ;-)

Search eBay with "female universal antenna" or "J0125A". Just make sure the listing image has "ESHOW" in the upper-left corner. The sellers are 'sworldwideseller' and 'eshowonline.store'. Currently the buy-it-now prices range from $3.69 to $3.99.

Baofeng is a fine radio, particularly if you factor price into it.

I've dropped mine a handful if times. Case a bit scratched but no effect on performance.

I recommended the $3.79 antenna. I bought spares. At that price its criminal not to.

It all boils down to if you care about what other people think about you based on what radio you use. I've gotten nothing but good reports on my transmissions, no one has told me I should have bought an Icom or Yeasu.

This radio has its quirks, but a little time tinkering and getting acquainted with your equipment is always a good thing. Programming can be done in the field, but you have to practice first.

Congratulations on you ticket. Now go buy a radio that fits your needs, your budget. Not one someone tells you that you need

The only thing I don't like is that it doesn't have VFO knob. I got use to them with my commercial radio.

  Baofeng is a fine radio, particularly if you factor price into it.
I've dropped mine a handful if times. Case a bit scratched but no effect on performance.
I recommended the $3.79 antenna. I bought spares. At that price its criminal not to.
It all boils down to if you care about what other people think about you based on what radio you use. I've gotten nothing but good reports on my transmissions, no one has told me I should have bought an Icom or Yeasu.
This radio has its quirks, but a little time tinkering and getting acquainted with your equipment is always a good thing. Programming can be done in the field, but you have to practice first.
Congratulations on you ticket. Now go buy a radio that fits your needs, your budget. Not one someone tells you that you need

Group,

I have to agree with Colin. Most of my operating when mobile and from home is VHF simplex, not repeaters. There is a world of difference between 5 W and 50 W. There is even a noticeable difference when going from 25 W to 50 W on 223 MHz. One can always raise/lower power as needed. If you have only 5 W, that is as good as it gets. In mobile applications, you may get quite frustrated using only 5 W. Additionally, using an HT mobile is hard service for the HT. When I first started, that is what I used for mobile simplex and repeater work. The HT can get very hot, not good for longevity of the unit.

Subject: Re: [baofeng_uv5r] Re: Import Communications

let's not forget simplex operations where higher power is sometimes needed.
Repeaters aren't the only way to communicate on 2M and 70CM.
And, if you do any highway travel, it's nice to have 50 wattts to stay into the repeaters a bit longer, or just maintain a good arm chair copy signal for the other party.
Yes, we're supposed to use the least amount of power to communicate reliably, however, cummunicating reliably, and having a nice clean QSO are two very different things.
someone can have 80 per cent noise on their signal, and as long as you can hear their audio, you can communicate reliably. But if they are full quieting into your receiver, the conversation can be much nicer.
and 5 watts to 50 watts can and will make the difference between noisy and full quieting.

8575. Resolved:Defective UV-5R from Radioshop888 no resolve had to open claim

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-23 14:00:54 UTC
From: Marc
Topic: 8382 Message: 8575

The charger was defective due to poor manufacturing.

Baofeng factory and Radioshop888 was no help.

The soldering on this charger was atrocious. Cold solders, no solders and solder splashes. Cleaned up flowed and reflowed all solder joints.

Charger is now functioning.

After claim was opened, Radioshop888 responded after 2 weeks of ignore. The radioshop said to return all items in the box for refund. Shipping not in the box was $16.95. In the box was $47.95. Not a cost effective solution. Baofeng said they do not handle warranty claims directly when not purchased directly from them,I would have to go through the seller.

Basically, with a cheap Chinese radio, you are on your own.

I have swept two of them. They are not good at all on UHF and inconsistent on VHF. One was resonant on 140 MHz, the other for 146. UHF were 388 and 401.

8577. will some one please clarify, concerning dual band antennas and harmonics

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-23 14:24:14 UTC
From: frankpasta
Topic: 8577 Message: 8577

Since the 440 band is the third harmonic of the 2 meter band, then of course I can use a 1/2 wave 2 meter antenna to transmit on the 440 band. I have verified this by consulting with other hams who seem to enjoy a greater knowledge of technical details then I. And yes,I have successfully used such an antenna myself with the Baofeng UV-5R. with no problems or damage to the radio. So why do I bring this up?
Because if this is technically correct then why do hams spend additional money of to acquire dual band antennas when we can call all just get away with using with a simpler and obviously cheaper 1st harmonic 2 meter antenna. Or is this just Antenna industry marketing scam? and none us really need these dual band antennas anyway.
Will someone of wisdom explain?

Are you referring to a half wave on 2m? Really? Are you sure?

A half wave is roughly 38" long. A 1/4 wave is roughly 19" The 1/2 wave antenna will need to be shunt fed with a transformer. The losses at UHF will not be practical and the pattern is questionable.

The radiation pattern of a 3/4 wavelength antenna is basically up and down. Yes, it will resonate, but your RF will not be at the horizon. The 3/4 wave antenna at UHF is useless.

All, most likely I will in time get my General license. How ever I am not interested in contesting, or talking just to talk. I'm part of a local REACT group. We work some 30+ walks/runs in the area each year. While we do have repeaters, we are limited in range as we get outside the city. A few of us are hams, if we can get a few more licensed, we could use a ham repeater when needed. This was/is my main interest in having a ham license.

I am not referring to any commercially sold antenna. If you construct a simple vertical antenna roughly 38 inches (a half wave on two meters) then they say that is appropriate. And once again, I know it works because I have used it>>>>Frank

Marc,
I'm glad you were able to repair the charger yourself. Unfortunately yours is not an isolated case. Although my charger works fine, I removed the bottom and remove some solder blobs that could have come loose and caused problems down the road.

I ended up buying the TYT BCG-F8 charger base ($13.50 from 409shop) and this is what I now use to charge my UV-5R. It is the charger that Baofeng should be shipping with the UV-5R. The UV-5R feels solid in the TYT base instead of sloppy like in the OEM base. The BGC-F8 also operates well at 13.8 volts (the OEM charging base shuts itself off at just above 13 volts) so it can be used in the car (with the proper cable) to charge the UV-5R or it could be hooked up to some other 10.0-13.8 volt power supply that you already have in the shack to eliminate a 'wall wart'.

> After claim was opened, Radioshop888 responded after 2 weeks of ignore. The radioshop said to return all items in the box for refund. Shipping not in the box was $16.95. In the box was $47.95. Not a cost effective solution. Baofeng said they do not handle warranty claims directly when not purchased directly from them,I would have to go through the seller.

A half wave vertical is not a simple antenna. A quarter wave vertical is a simple antenna.

A half wave vertical will require a transformer to work. Is the antenna design you are thinking about one that will require a transformer?

Marc

Does your

Paul,

Yes, a 1/4 wave on 2m is almost a 3/4 wave on 70cm. But I don't think the OP even knows what he is asking about. He mentions in the OP "DUAL BAND" antenna. Then he is talking about 1/2 wave at 38". This is unlikely, because the odd multiple of a half wave at 146 MHz falls at 876 MHz. Not to say that a half wave has the odd multiple rule apply as the OP has stated.

The rad pattern of a 3/4 wave ant is up, which as I said earlier, is not useful, as we want our RF at the horizon, not the moon.

Dual band antennas are stacked colinear arrays that utilize various portions of the antenna based on frequency dependency. So, a dual band antenna may be a 1/2 wave on VHF (coil xfmr at the base) and a stacked 5/8 over 5/8 at UHF, which is created by the center phasing coil(s).

Marc

End feeding a quarter wave or an odd multiple is a low impedance
feedpoint. End feeding a half wave is a high impedance, on the
order of 1000 ohms. At the start of the antenna, the current is
high and the voltage is low. At the 1/4 wave, the current is low
and the voltage is high. At the half wave point, the cycle starts
again. At the 3/4 wave point, it's just like the 1/4 wave point,
only reverse polarity. As stated, the pattern of the 3/4 wave is
not very useful in terrestrial service. A 5/8 wave antenna is 1/8
of a wavelength short of a 3/4 wave and the last 1/8 in horizontal
to it doesn't affect the pattern of the 5/8 wave part and the
additional 1/8 wave makes it electrically easy to match to 50 ohm coax.

A half wave dipole is really 2 quarterwave sections fed in the middle.
A dipole is a balanced antenna, meaning it's terminals are equal and
opposite. Coax is an UNbalanced feedline and requires a balun to
connect to a dipole unless you want a really bad radiation pattern
and hot coax in the shack (bad!). A quarterwave groundplane is a
variation of the half wave dipole. You have a radiator and a
ground image to complete the circuit. The ground plane decouples
the antenna from the shield of the coax keeping the current inside
the shield where it belongs.

Finally, an antenna is a tuned AC circuit. It has inductance in the
wires and elements and capacitance between them. The E fields build
up and create magnetic loops. Together, this creates the E-M wave
but the radiator must have something to work against.

Frank,

So you do have a commercially built 1/2 wave antenna at 2m. If the antenna is a 1/2 wave at 2m, then no, it is not an efficient radiator at UHF. If you have a simple quarter wave, yes the antenna is a 3/4 wave at UHF, but the pattern is not desirable for repeater or simplex work.

The commercially built dual band antennas deal with the different characteristics of pattern and resonance by utilizing transformer and phasing coils. Whereby, an antenna may be a half wave with shunt feed (which negates the ground plane requirement) at VHF and stacked elements on UHF which will exhibit gain and usable pattern on both bands.

I would also be cautious of the gain figures some manufacturers are using these days. I do not use dBi as a figure of merit. dBd or dB/1/4 wave are true gain figures based on a 1/2 wave dipole and quarter wave reference antenna. The advertised gain of dBi is actually 2.1 dB higher than dBd.

Marc

How do you know when the battery is fully charged? TFM doesn't seem to say anything about it, and it doesn't appear to be obvious (e.g. red when charging, green when charged.) Mine is alternating between red and green, 3 times longer on red than green, and it's been charging now for several hours.

Dunno about your charger Julian,
Mine just goes green when done. Never timed it, maybe 3 hours? Might time it next time.

Subject: [baofeng_uv5r] Charging indication

How do you know when the battery is fully charged? TFM doesn't seem to say anything about it, and it doesn't appear to be obvious (e.g. red when charging, green when charged.) Mine is alternating between red and green, 3 times longer on red than green, and it's been charging now for several hours.

Hello

Can I ask if there is anyone in the group who has their UV-5r all setup with the full set of UK repeaters. If so would they be so kind as to post a file with them in so I could get a couple done for my friends who are coming over from the US for a couple of months. I also have one and have only got a couple of local repeaters in Id do the others but im diabled and its hard to use my fingers due to my illness. So just wondered if there was a kind soul out there That could possibly help.

Many thanks

Regards Andy

I GREATLY respect Jim and his many contributions to this forum, but I would like to submit a contrary opinion, because I have been a Kenwood owner for a very long time and find it extremely easy to program my Kenwood radios "by hand." I can program a new frequency into a memory channel in less than a minute.

TM-631A 2m/222 mobile
TM-733A 2m/440 mobile
TM-741A 2m/222/440 mobile
TM-742A 6m/2m/440 mobile (three of them)
TH-F6A 2m/222/440 portable

A simplified version of entering a repeater frequency:

Step 1: push "VFO"
Step 2: turn dial or push buttons for frequency
Step 3: push button once or twice for "shift"
Step 4: push button for "tone" enable
Step 5: turn dial or push buttons for tone frequency
Step 6: push "function" then "MR" for memory entry
Done

I have had some experience with Icom radios and some of them are much more complicated. But I really like my Kenwoods!

Having said all that, I can also program the BaoFeng manually in about a minute or two, having learned (mostly from this mailing list!) how to do it quickly and easily. I find this skill to be valuable for those times when someone says, "Hey, there's a new repeater in town," or similar.

I agree virtually 100 per cent with everything else that Jim said in his posting. Thanks for your contributions!

Waldan asked:

> Does anyone know if these radios will still be usable after the looming US
> digital radio switch over for commercial repeaters?

Then later clarified it to mean U.S. commercial narrow-banding.

Fact: The new narrow-banding rules DO NOT APPLY to amateur radio.

Opinion: Hams should start thinking about and discussing voluntarily
narrow-banding, so that more frequencies will be available for more
repeaters.

So the narrow band requirement set for January 2013 in the US won't effect HAM use or equipment?

I ask because many
HAMs in my area have been discussing it and the consensus around here is that it would and older radio incapable of the 12.5khz shift would no longer be allowed to be used.

That is correct; the new narrow-banding rules DO NOT APPLY to amateur radio, only to business and public safety.

> I ask because many HAMs in my area have been discussing it
> and the consensus around here is that it would and older
> radio incapable of the 12.5khz shift would no longer be

What is a polite way of saying that the consensus is wrong? The new narrow-banding rules DO NOT APPLY to amateur radio.

Public safety and business radios that are not capable of switching to 12.5 KHz in January cannot be used for public safety and business radios. However, if those radios go into the used radio market, hams should be able to use them.

Simple answer is, no. There is no narrowband mandate for part 97. Amateur radio is not affected by the mandate.

@ Dave, I thought about it. I prefer wideband analog.

Marc

If that's what the majority of hams want, then so be it. But we should discuss it in the context of the changes made back in the seventies from 30 KHz channel spacing to 15 KHz channel spacing.

If we want more "channels," then we need to go to narrower "channels." If we think what we have is fine, then we should not make any changes, but we should talk about it. (Not on this list, however!)

Thanks for that reply but I am not needing the information for the ham bands I am planning to use this HT for ham and work both. My work repeater will be effected with the narrowing change over. I would like to know if it will still be usable for commercial uhf u.Der the new narrowing rules after Jan 2013.

Wally-

The UV5R is FCC-approved for narrow band operation in the part 90 services. Just be sure you set any part 90 channels to "narrow" operation (menu #5 -WN).

Opinion: Hams don't need to switch to narrow banding to be able to get
more repeaters. We have too many repeaters already that no one is uisng.
Why do we need more?

This topic made me laugh because I am knee deep in studying for the General after having passed the Tech, last week.

I'm laughing because I just went through a section of material that hit me like a foreign language I don't know.

Why am I doing this when most of my work will be with my CERT team and the Tech will be enough?

Because I actually am learning some new things even though many are going over my head, I'm intrigued by the possibility of getting deeper into the hobby side AND one thing that may only apply to a a very few people: I want to become a General VE so that I can be on a team that issues Tech exams. I live in a very small town. We have a very active CERT team and all are encouraged to get Tech licenses. To test, we have to travel a good ways. We have 2 General VE's; so if I get mine, we can test -- or that's how I understand it.

So, back into a book full of stuff that is stretching me -- which, for me, is good.

Best,

Steve

8619. e-Bay Warranty

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-23 20:11:04 UTC
From: Chris Ruhl
Topic: 8619 Message: 8619

What is the feeling overall on the "aftermarket" warranty offered by e-Bay on these radios, typically costing about $8 USD or so? Boafeng lists a warranty in the manual but only if stamped and dated by the dealer, with a note saying, "Best buy from local dealer."
As one other chap found out with Radioshop888, one can be very well "on their own" and have nothing.

Most guys in my ham club have bought these Baofengs with the idea of them being $50 disposable radios. They carry them in harsh areas, on their bicyles, figuring if it breaks, they're not out a $200+ Icom or Kenwood or whatever, which is their primarly HT (especially if they are into D-STAR). When my UV-5R came, I was very much impressed with the quality physical construction, the overall "feel" of the radio, and I found out that it rivals more expensive radios with actual performance. The guys in my radio shop at work were dumbfounded by the quality for the price, most thinking that the radio cost considerably more (3 to 4 times as much) than it actually did. Thus, there is a strong temptation, and feeling, to see this radio as a more expensive model. Yes, the programming can be funny (they call are) and the TDR functions on the Baofeng can be annoying when compared to a Wouxun but I purposely kept the Wouxun out of service and gave the UV-5R a good run. Once one gets over the "humps" and sees how basic everyday usage (like TDR off and on, power levels, etc.) can handed with menu and keypad, this could be a nice starter radio for a new ham on a very limited budget, particularly high school kids. I know a school teacher who has purchased a large number of these radios for school club use. So long as you keep transmissions reasonably short, and don't get too long-winded or talk for hours, it's a good way to help get kids into the hobby and not risk busting an expensive radio.

I use mine and both a ham radio and a scanner, and it is a decent receiver, even on some of the public service frequencies in the 502.000 Mhz range.

All that considered, I would love to see better handling of sales and warranty issues, perhaps local dealers like with the Wouxuns. But, then again, the very cheap cost of these things comes with a tradeoff. For about double the cost you can have the comfort of a local dealer return policy with Wouxun. The other big issue seems to be fake components from "no name" e-Bay sites in China. Put "Fake Diamond Antennas" into any browser search and you'll find at least three hits. Somebody I know thinks that they got a fake $3.99 Nagoya RA-771 as well, or poor quality control such that the antenna had a SWR of almost 20:1 at 146.000 Mhz. Considering that a fake antenna could damage or shorten the life of these radios, I only buy HT antennas from known, good sources (HRO, AES, others here in USA).
Meanwhile, you have an antenna that may work for a scanner but possibly not much else.

As for poor solder joints and such, anybody who has obtained a quirky item from MFJ here in the states knows much about that! The flimsy Baofeng charger, though, doesn't seem to match the radio as far as quality goes. Mine acts quirky as well. I may open it and check it for solder as well.

Julian,

I've mentioned this a couple of times before. See message 4157 for one of them.

http://groups.yahoo.com/group/baofeng_uv5r/message/4157

My OEM charger also has an indication between continuous RED (charging) and continuous GREEN (charging complete) where it slowly alternates RED/GREEN/RED/GREEN. This indication is completely different than the Standby (no-load) indication where it is a continuous GREEN with pulsing RED. I have never figured out what this indication represents nor do I know how long it lasts. I just know that eventually the indication goes continuous GREEN and the charging cycle is complete.

Now that I use the TYT charger, I just have a no-nonsense RED (charging) and GREEN (charging complete) indication and no long have to "Prevent cooks meals...". ;-)

I'd be really be interested in some feedback regarding the Standby (no-load) Charging State. Plug in your charger base without a battery in it. Now look at the LED. I mean really look at it. Is it really alternating RED/GREEN? Mine doesn't. On mine, GREEN is continuous and RED is pulsing. This is consistent with the manual and quite different from what Julian is describing.

Good for you, Steve!

But I want to answer this, why get a General ticket, for other new Techs.

UHF and VHF, even with repeaters, cover at most roughly a county area. You can't depend on Echolink or other phone/internet connections when real emergencies happen.

A tornado or fire might be local, but where I live, it's hurricanes and widespread flooding we worry about. Having lived on the U.S. Gulf Coast for most of my life I've seen it more than a few times.

When you really, really need to call for "lawyers, guns, and money" VHF/UHF is not going to fill the bill. You need HF.

In addition to my VHF gear, I have an HF "go kit". Yes, a 100 w rig (Icom 718) mounted in a Pelican case, and several different portable/emergency/field day antennas to choose from. Field Day was not the goal... it is a test, it is only a test of the... well, you know the words, sing along. I've literally made contacts coast to coast from here with 100 w SSB, running off batteries, and a portable antenna. (Even more fun, talking to someone 1500 miles away doing the same.)

Working HF, understanding propagation, which bands to use during what time of day, is an important skill that you need. Guys whose primary interest in ham radio is for EMCOM might be interested to know there are MANY emergency nets on 75, 40, and 20 meters. 40 meters is used mostly during the day because it is more regional, covering your state and the states around you, and a bit more. 75 meters fills this need at night. You need a General license to use SSB phone on the these HF bands.

Hurricanes Katrina, Rita, Gustav, and Ike were all regional, covering large portions of several states.

During Hurricane Isaac we (our club station) checked in with the Louisiana Hurricane Net, Louisiana Traffic Net, La ARES net, and there are a number of such nets in the HF bands. Texas, MS, AL, FL all have similar nets on pretty much the same frequencies. I'd be glad to share the list with anyone who wants it, my call at arrl dot net.

Anyway, consider the Tech license a MINIMUM requirement. Get your feet wet, and keep studying.

BTW, Steve, I find being a W5YI CVE (and ARRL VE) VERY rewarding! I think you will, too.

73,
Paul - AE5JU

I got mine for $48.69 on Amazon. At that price if it breaks take the battery off it and the belt clip and the antenna and chi.k the radio and buy another one. It is not coat effective to repair a radio at that price.

Chris Ruhl <cdruhl@...> wrote:

What is the feeling overall on the "aftermarket" warranty offered by e-Bay on these radios, typically costing about $8 USD or so? Boafeng lists a warranty in the manual but only if stamped and dated by the dealer, with a note saying, "Best buy from local dealer."

As one other chap found out with Radioshop888, one can be very well "on their own" and have nothing.

Most guys in my ham club have bought these Baofengs with the idea of them being $50 disposable radios. They carry them in harsh areas, on their bicyles, figuring if it breaks, they're not out a $200+ Icom or Kenwood or whatever, which is their primarly HT (especially if they are into D-STAR). When my UV-5R came, I was very much impressed with the quality physical construction, the overall "feel" of the radio, and I found out that it rivals more expensive radios with actual performance. The guys in my radio shop at work were dumbfounded by the quality for the price, most thinking that the radio cost considerably more (3 to 4 times as much) than it actually did. Thus, there is a strong temptation, and feeling, to see this radio as a more expensive model. Yes, the programming can be funny (they call are) and the TDR functions on the Baofeng can be annoying when compared to a Wouxun but I purposely kept the Wouxun out of service and gave the UV-5R a good run. Once one gets
over the "humps" and sees how basic everyday usage (like TDR off and on, power levels, etc.) can handed with menu and keypad, this could be a nice starter radio for a new ham on a very limited budget, particularly high school kids. I know a school teacher who has purchased a large number of these radios for school club use. So long as you keep transmissions reasonably short, and don't get too long-winded or talk for hours, it's a good way to help get kids into the hobby and not risk busting an expensive radio.

I use mine and both a ham radio and a scanner, and it is a decent receiver, even on some of the public service frequencies in the 502.000 Mhz range.

All that considered, I would love to see better handling of sales and warranty issues, perhaps local dealers like with the Wouxuns. But, then again, the very cheap cost of these things comes with a tradeoff. For about double the cost you can have the comfort of a local dealer return policy with Wouxun. The other big issue seems to be fake components from "no name" e-Bay sites in China. Put "Fake Diamond Antennas" into any browser search and you'll find at least three hits. Somebody I know thinks that they got a fake $3.99 Nagoya RA-771 as well, or poor quality control such that the antenna had a SWR of almost 20:1 at 146.000

Mhz. Considering that a fake antenna could damage or shorten the life of these radios, I only buy HT antennas from known, good sources (HRO, AES, others here in USA). Meanwhile, you have an antenna that may work for a scanner but possibly not much else.

As for poor solder joints and such, anybody who has obtained a quirky item from MFJ here in the states knows much about that! The flimsy Baofeng charger, though, doesn't seem to match the radio as far as quality goes. Mine acts quirky as well. I may open it and check it for solder as well.

there is another good one, and that is saleseshop.
I bought both of my j0125a's from there for 3.99USD with free shipping.
Saleseshop bends over backwards to communicate with their buyers as well and are very communicative, if not necesarily terribly comprehensive in english writing lol.
I went with these guys because the other sellers, though having lower prices on the antennas, charged a little bit for shipping, so the total would have come out higher.

Search eBay with "female universal antenna" or "J0125A". Just make sure the listing image has "ESHOW" in the upper-left corner. The sellers are 'sworldwideseller' and 'eshowonline.store'. Currently the buy-it-now prices range from $3.69 to $3.99.

good idea, open the battery charger and check it for solder, there may be none hi hi :)
I agree with the rest of your post.
I'd much rather take my UV5R with me, with the 3.79 antenna on it, and know that if I break the antenna, which we all know happens more often than we like to think, it's not much money or inconvenience to me.
I know that if I drop the radio off a tower or out of the window of the car while I'm sticking the antenna out to get into some repeater or other, I'm not going to shed too many tears over it...though a few because it's such a damn good little radio.
I find myself leaving my kenwoods and icoms at home more and more because of these very reasons.
Though I still drag the TH F6A out from time to time because it has the 220 band and also has HF including SSB receive capability.
I would gladly pay double, IE 100 bucks for a baofeng that has a fully featured HF receiver in it like my icom T90a or my kenwood TH F6A lol.
I know, it would require another chip in the radio, but surely that wouldn't increase the size or weight too much, and just think how many hams would jump on that...especially if the HF receiver was a good one, they could sell it as an SWL radio as well...
Also, someone over there needs to either clone, or get the rights to the DStar chip and produce a DStar radio around the same price point as the uv5R...or again, perhaps double, or even tripple the price...you would still be saving 500 bucks for a DStar enabled HT.
I'd like to get on DStar, but there is no way I'm going to drop almost a grand on a mobile, or 500 bucks plus on an HT to use it.

hey, it gives you an edge on the tech license holders at the coffee breaks. They'll be picking your brain now because your knowledge will be greater then theirs...
I echo the sentiments of the other posters though. You never know when you might need to or even just want to operate HF for whatever reason.
It's not particularly difficult to obtain the extra class license if you study and put some effort into it. It's always nice to know how to design and build circuits anyway...it can help you figure out how to build your own stuff even for VHF and UHF work.

Good memories, Jerry... Had one on 2 and a G-50 on 6.

That's back when none of us worked 450MHz because the equipment was
only good for a few hundred feet line of site.

I suspect narrow banding for amateur bands in very densly populated RF areas, like the north eastern US might be advisable...but most of north america isn't that densly RF populated so it doesn't make much sence. hams usually follow commercial band changes after a while anyway, so give it ten years or so and we'll all be narrow banded like the UK.
Of course, they also have half the band width over there as north america does, so it makes good sence to go narrow band when you only have 2MHZ to play with.

8638. Power cable??????

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-23 23:44:42 UTC
From: w2eec
Topic: 8638 Message: 8638

Hey all.
I have noticed many times in the manual on page 4 "Accessories" it shows a power cord that plugs in to a giggaret lighter outlet and has a Kenwoo/Wouxun style plug on the other end. Has anyone seen these for sale or was it just a pipe dream. I would much rather have that than use a charging base and a Car adapter cable to charge the UV-5R.
If not, has anyone put any thought in to haw to make one if it can be done?
I don't know how the circuit is set up and if the UV-5R can handel it.
I also wonder if some other HT uses this kind of power cable and if that cable from the other HT could be used on the UV-5R?
Any help would be awesome. Thanks.

If you are talking about the change mandated to narrow banding, it does not affect the ham bands.
And yes, these little hand helds can be set for wide or narrow banding.

Also, someone over there needs to either clone, or
get the rights to the DStar chip and produce a DStar radio around the same price
point as the uv5R...or again, perhaps double, or even tripple the price...you
would still be saving 500 bucks for a DStar enabled HT.
I'd like to get on DStar, but there is no way I'm
going to drop almost a grand on a mobile, or 500 bucks plus on an HT to use
it.

I keep hoping the GRE will manage to add DSTAR decoding to it's digital P25 scanners.
The PSR-500/600 and PRO-106/197 could use a DSP version 1.5.

Both my batteries and charger have +, -, and "T"
characters
molded into the case near the battery terminals.
The + and -
terminals are used to charge or use the battery.
The T terminal
is not connected in the charger, and measures about
9.92 Kohms
to ground in the battery.

FYI, one of the U.S. Wouxun dealers, Import Communications (also wouxun.us) also sells the UV-5r (www.uv-5r.com). While their prices are a bit higher than the Chinese sellers, they provide quick shipping / delivery and warranty (and also out-of-warranty) service for the products they sell. [My only connection to Import Communications is as a very satisfied customer.]

Both of my units show flashing green/red ratio of 3-1 when no battery in charger. Solid Red when in the charge mode and solind Green when fully charged.

I have had zero problems with eith of my units... knock, knock.

Doesn't seem to be a temp sensor - measured about 9.92K
at 90 deg F room time and about 9.90 after an hour in the freezer.
I expected a temp sensor but didn't see much variation there
to work with. Possible it changes radically at some high temp
point

I suspect the battery has a normally closed temperature switch that opens when the batteries temperature gets too high, signaling the charger to stop charging until the battery cools down and the switch once again closes.

That may be true but it depends upon where in the country you reside. In some places, a person can pick a frequency that is not being used and put up a repeater. Heck, I've even heard of places where there are no 222 repeaters at all.

However, in other places, mostly large cities and other metropolitan areas, there are more groups that want to put up more repeaters.

One could argue that since there are repeaters that are "quiet" (not used very much), that those repeater owners should let other people use those repeaters. I would argue that while everyone is entitled by their license to use any frequency for which they are licensed, everyone is NOT entitled to use every repeater, as the repeater equipment is privately owned and the FCC has stated that repeater owners are within their rights to control access to their equipment if they wish.

These types of discussions should take place in the context of local or state coordinating groups so that local people can make local decisions. If enough local groups want to either remain the same or change to narrower channel spacing, then that will happen (very slowly).

By the way, I really enjoy my UV-5R!

so what does this thing look like? is it a small piece that fits over the bottom of the battery, like a small charging cup that you can connect to the cigarette lighter?
I know you can get what they call a battery eliminator for the UV5R...it goes in place of the actual battery and has a cable that terminates in a cigarette lighter plug.
but you obviously can't charge your battery with that particular device as it goes in place of the battery on the radio.
There is no charging jack on the UV5R, so I don't know how you would connect such a thing as you mentioned from the manual.
someone did say something about charging through the speaker mic jack, but I don't think this is possible either.
you have to somehow charge through the contacts on the battery...it wouldn't be awfully hard to build something that could do that if you really wanted to.

Colin.
If you look in the manual, page 4, bottom left side. It shows a picture of it.
It looks like a the regulated cigarette lighter power plug that is used on my Yaesu adapter with a Kenwood/Wouxun style plug that plugs in to the both the SP/MIC holes.
If they show it, I would expect that there was a plan to use it so the charging circuit may be in the UV-5R. I wonder if anyone checked?
I wonder why no one ever asked about it.

Nope. I was not talking about a USB cable. I don't think a USB port would ever be able to put out enough power for the UV-5R>

the uv3r battery is 3.7V, so yes, it can be charged via USB.
the uv5R battery is 7.4V, so no, a 5V maximum USB outlet won't work.

so what does this thing look like? is it a small piece that fits over the
bottom of the battery, like a small charging cup that you can connect to the
cigarette lighter?
I know you can get what they call a battery eliminator for the UV5R...it
goes in place of the actual battery and has a cable that terminates in a
cigarette lighter plug.
but you obviously can't charge your battery with that particular device as
it goes in place of the battery on the radio.
There is no charging jack on the UV5R, so I don't know how you would connect
such a thing as you mentioned from the manual.
someone did say something about charging through the speaker mic jack, but I
don't think this is possible either.
you have to somehow charge through the contacts on the battery...it wouldn't
be awfully hard to build something that could do that if you really wanted
to.

interesting.
I would think they might be using the microphone input jack only and that
the speaker plug part of the two pin plug is a plastic dud, because as soon
as you plug any 2.5 regular stereo or mono plug into the speaker jack, the
internal speaker on the uv5R is muted.
In which case, a single 3.5MM TS (tip sleeve) style plug should work.
Unless they got tricky and are using a TRS (tip ring sleeve) style plug and
using either the tip and ring, or the ring and sleeve for the dc input.
someone on list has to know one way or the other...
If it shows it in the manual, it must work.
odd to say the least, but there you go...wouldn't be the first odd thing
about these LCR's lol.

ok, so there are either some variants in the wouxun antennas, or the j0125a's are not all equal.
The two wouxuns that I compared to the other day both had slight differences between their stock antennas and the j0125a's that I received.

absolutely.
unfortunately it sounds like it's a non-regulated unit, which means you will have to be cautious about over charging and leaving it plugged in to the radio for extended periods of time.
From what I've read the UV5R batteries do have their own protection circuitry built in, but I would think that using a cigarette lighter adapter that doesn't have the same charging circuitry as the desktop charger might limit the overall life of the battery given many uses.
Though, you can probably take the battery off if you intend on running the radio for extended periods of time in the vehicle.
let us know what Ed says.
Perhaps he'll chime in here since he watches this group as well.

Right. And that's probably why it wasn't implemented on the UV-5R like it was on the UV-3R.

I'm curious if any vestigial charging circuitry might have made it to the UV-5R, though.

well, since the UV3R uses a commonly availible camera battery, it doesn't have the rear contacts for a charger base.
So, therefore, it has a side charging jack which makes it easy to use external DC power sources to both charge, and operate the radio.
different design all together.
Of course, the UV3R plus changed this design and uses a different battery with the charging contacts on the back of it...and so they removed the dc jack on the side as well.

Well my little Baofeng died today. It transmits fine but the receive is dead. It emits an odd pulsing type sound and the audio is very low and distorted. Also, sounds like the squelch is open yet very low volume and again is a pulsing type sound. Guess I will try to send it back or just toss it. Don't think I will buy another one but it was fun while it lasted- maybe a month?

>

This is interesting because Ive recently purchased 3 x JO125a antennas (supposedly !) from an ebay seller in China - They all work ok, marginally better that the stock Baofeng antenna. However they are about 24mm longer than my stock antenna on my Wouxon UVD-1P .. Which works very well .. Probably somewhat better than the JO125a . So it seems that there may be different 'flavours' of the JO125a antennas floating about perhaps.
Just for interest sakes my JO125a antennas are all exactly 214mm from tip to botom of sma and my Wouxon stock antenna is 190mm from tip to bottom of sma. Curious to know how long other peoples JO125's are ?

I don't think this is true. I just measured with the programming cable attached and no battery, and got a stray 0.91V across the terminals. That would not charge the battery.Ian

Had a look over the circuit diagram for the uv-5r .. I cant see anything in the circuit that would indicate charging ability through the mic / speaker sockets. Maybe this is a Chinglishy error in the manual, possibly a hangover from the uv-3r manual or maybe there is some circuitry in the radio that does accommodate charging through these sockets, however its not on the circuit diagram.

Regards .. Andrew

Thanks Roger. Mine did eventually go green some time during the night but up until I turned in it had been on for a helluva long time. Previous times I stopped charging before the solid green and the battery lasted pretty well.

Thanks, Jim. I do recall that posting. I did eventually get a continuous green but before that it was slowly alternating and apparently charging. It took a lot longer than the 3 hours someone mentioned. I haven't seen a continuous red but perhaps you have to run the battery right down to empty.

Julian, G4ILO

> http://groups.yahoo.com/group/baofeng_uv5r/message/4157
>
> My OEM charger also has an indication between continuous RED (charging) and continuous GREEN (charging complete) where it slowly alternates RED/GREEN/RED/GREEN. This indication is completely different than the Standby (no-load) indication where it is a continuous GREEN with pulsing RED. I have never figured out what this indication represents nor do I know how long it lasts. I just know that eventually the indication goes continuous GREEN and the charging cycle is complete.

Hello all,

Well I have to say "I am enjoying the look, feel, and size of my new little toy thus far." It is the perfect size to slip in a small bag and head to work or just for a drive somewhere to monitor some freq's. Some how I reversed the language of the radio back to Chinese so it looks as if I have some reading to do today. I haven't attempted the programming cable thing yet just hand hacking everything into it. For me, I feel it is important knowing my learning style to get to know the radio a little more intimately this way first. Having fun now!

Yes you can program in and use the VHF marine channels but remember this HT is only 5W if you are lucky. My advice, DON'T use it as your primary VHF Marine radio. A standard shop-bought VHF Marine radio has an output of 25W 5X the HT.
Don't know about 445Mhz it is not in the marine band. Data Channel ?
If you call up any Marine Rescue stations (on ch16)in Oz they will gladly give you the latest weather predictions for your area, saves them sending out a rescue.
By the way, you have to have an operators license to use any radio on the VHF Marine band in Australia.

Cheers Mike (ENC782)

Steve,

You will be glad you kept studying for your General. Congratulation on your Tech license. I understand you want to be able to assist on

the testing of new and upgrading licensee's. When you get your General, you and the other two General hams can form a team and test

the "Tech" level license. If you and two more General hams upgrade to "Extra", the team could test for all three levels (Tech, General and

Extra). I have been doing the testing for over 15 years and it is very pleasing to help people learn and enjoy the hobby.

Your continued studying will help you better understand the ever changing technology of electronics. There is always something new to learn.

Randy,
This only partially works. CHIRP won't export any channels that have TX inhibited (Duplex is set to 'off'). So in my case, more than half of my channels would be missing.

8698. Repeaters List

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-24 21:42:49 UTC
From: Jim
Topic: 8600 Message: 8698

Hi,

Does anyone know of software or a website that will pull up repeaters along a proposed travel route?

I live in the Milwaukee, WI, USA. Lets say I wanted to take a driving vacation along the northern part of the US to the East Coast, turn north into Montreal, and make the return trip through Canada. Is there any place on the internet to put in an itinerary and pull up the best repeaters along the way?

Heck, even a list of "good" repeaters would be an asset. We have lots of repeaters in our area, but two or three seem are used the most. I presume that would be the same in most areas.

With Chirp and the Baofeng's 120 memories, pre-programming a whole trip looks almost possible, if the information is good.

Jimmie

Isn't that the same UV-5R VIP software version that's on the 409shop website from 2012-4-19 (still showing there as the newest version)?
http://www.409shop.com/shop_displaynews.php?id=292&locate=1
Are you sure?

the j0125a I have here right now is 211MM long as near as I can tell.
Measuring from the tip to the bottom of the SMA connecter.
taking into account margin of error and using a standard digital tape measure, I would hazard a guess and say mine is probably 214 as well...the difference of 3MM could be the tip cap of my antenna being slightly shorter than yours.
my tape isn't perfectly accurate, and I don't actually have a ruler here to check :)
but the wouxun stock antenna being 24MM shorter lines up with my observations as well.

>
> I decided to order an antenna from eBay member "esupermarket010" for $3.49. It was described as a "J0 125A female". When I received this antenna (pretty promptly from China) I was surprised to see it was the exact same antenna that is supplied with the Wouxun.
>

This is interesting because Ive recently purchased 3 x JO125a antennas (supposedly !) from an ebay seller in China - They all work ok, marginally better that the stock Baofeng antenna. However they are about 24mm longer than my stock antenna on my Wouxon UVD-1P .. Which works very well .. Probably somewhat better than the JO125a . So it seems that there may be different 'flavours' of the JO125a antennas floating about perhaps.
Just for interest sakes my JO125a antennas are all exactly 214mm from tip to botom of sma and my Wouxon stock antenna is 190mm from tip to bottom of sma. Curious to know how long other peoples JO125's are ?

Regards .. Andrew VK5EX

The software in the dropbox shows:
It shows V12.7.25 VHF 136-174 UHF 400-520MHz
The 520MHz would be for BFB291.

8708. Antenna swept return loss measurements on OEM and $3.79 Antennae

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-24 22:31:02 UTC
From: Don
Topic: 8708 Message: 8708

I have uploaded a couple of pics showing the swept return loss of the OEM antenna and the $3.79 antenna to the Album "Antenna swept return loss" in Photos. The photos are best viewed in the "original" resolution.

Both antennae were swept from 100 MHz to 600 Mhz with an HP 8924C service monitor. A Minicircuits ZFDC-20-5 directional coupler was used as a return loss bridge.

As can be seen in the pics, the $3.79 antenna is a better performer in the VHF (2M) band with a return loss of 20.7 dB at approx. 150 MHz compared to about 9 dB of return loss for the OEM antenna.

In the UHF (70 cm) band, the $3.79 antenna was marginally better than the OEM antenna with a return loss of about 14.5 dB at about 410 MHz. The OEM antenna weighed in at 12.9 dB of return loss at 427 MHz.

We have had a few folks that had PTTs break away from the board. A way to test it would be to use the earpiece/mic that came with the unit and see it that works.

Also check to see if the same condition exists on all other channels to elimate a programming issue.

Plan your route and then download the repeater data as *.csv file (Comma Separated Values). Import into CHIRP or other program you may be using.

Referring to my previous post...

on the http://k5ehx.net/repeaters/qrepeater.php site scroll down to "Directions" and enter your origin and destination. Example, Lafayette, LA and Destin, FL. The program will map your route on Google Maps, and then mark repeaters.

Then you download the repeater data as *.csv.

Jim,

I am a full time RVer and use Google to find the repeaters. The hard part sometimes is knowing what county you are in. I have found that many lists are not so up to date and certainly a printed version is surely out of date before it's printed.

Here is a site for the NY Repeaters: http://www.nyrepeaters.com/

And one for New England: http://www.nerepeaters.com/

It's not easy finding the active repeaters unless you stay in an areda for the better part of a week. Most any contact you make will tell you which ones draw. Alsi many of the repeaters listed have a website, usually of a club associated with it and on there you can tell if they are active....nets and such.

Hope this helps, safe travels.

John

Subject: [baofeng_uv5r] Repeaters List

Hi,

Does anyone know of software or a website that will pull up repeaters along a proposed travel route?

I live in the Milwaukee, WI, USA. Lets say I wanted to take a driving vacation along the northern part of the US to the East Coast, turn north into Montreal, and make the return trip through Canada. Is there any place on the internet to put in an itinerary and pull up the best repeaters along the way?

Heck, even a list of "good" repeaters would be an asset. We have lots of repeaters in our area, but two or three seem are used the most. I presume that would be the same in most areas.

With Chirp and the Baofeng's 120 memories, pre-programming a whole trip looks almost possible, if the information is good.

Jimmie

You dont need a licence to operate a marine radio in aussie,Its only a course to each you how to use it and how to make calls etc and you cant get a 25W handheld radio..........Well with out the assistance of a linear and carrying around a car battery,VHF marine handhels are 5W max and some mobile units are only 5W

It must have changed at some stage...

Years ago you had to have a " 3rd class radio operators certificate of proficiency " to be allowed to transmit on VHF marine... as for 27 MHz marine, it didn't matter..

Cheers,

Rob.

I find that to be a common issue with Win7 64 bit. U can install a virtual XP from MS that will solve this issue. I use an old HP with a serial port and run XP for all my radio programming needs.

8720. UHF Baulan

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-25 01:12:17 UTC
From: Pit Bull
Topic: 8720 Message: 8720

Has anyone made or tryed out a UHF Baulan on a UV-5R yet???
I'm trying to find out how to make a UHF Baulan that will go from 400MHz upto 480MHz as they are already a tuned circuit and would make it soo much easier for a long wire

8721. Re: [baofeng_uv5r] UHF Baulan

On UHF? Perhaps you are referring to a RF choke design very simple and no long wires.

Where can one purchase this $3.79 antenna that you talk of cuz im in need of a better one for mine cuz i live in an apartment & its a downstairs unit thats halfway to the bottom of the complex & im in the process of finding a better replacement? Thanks.

Its a baulan,you can get HF baulan's easy enough but nothing for UHF that I've seen,All it does is make it from a PL-259 socket into 2 output terminals for a long wire or what ever it gets used for

I had the jitters here too but I didn't have my programming cable plugged. It appears that this software tries to detect the com port and it fails ungracefully if it doesn't find one. Once I plugged it in, the software launched fine.

Firstly I think you might need to get your head around the physical measurements of the wave lengths of the UHF spectrum you are referring to. Then you will suddenly understand "long wires" no longer apply. And perhaps look at collinear designs instead DC grounded both for receive and TX gain.

Topic: 8708 Message: 8727

Veri interesting info about the antennas. Thanks.
I am about ready to order one but I had a quick question about other brand antennas that may have been tested. I have in the past mostly used the Nagoya NA-701s and the NA-771s. Has anyone ever checked them?
I have two of each and if they are OK then I'll go with one of those but if if this one is better then I am placing my order. Thanks all.

I know the wavelenght is 67cm and in theory a 67cm long peice of wire is a full wave antenna BUT as we all know in saying that it might not be accurate and to test it a UHF SWR Meter is needed and that sucks cause I dont have one yet and a HF SWR Meter cant be changed for UHF:|

Another option is Ijust modify my MK2 station master by drilling the rivet that holds the coil onto the base as its just a length of pipe

I added another photo showing the swept return loss on a Diamond RH-77CA dual band antenna. This antenna has a BNC connector but can be used on the UV-5R with a BNC-female to SMA-female adapter. This is an even better performer on 2M with a 23.6 dB return loss at 154 MHz. It is slightly better on 70 cm than the $3.79 antenna and the OEM antenna. --- In baofeng_uv5r@yahoogroups.com, wrote: > >

Very interesting ! I almost tried that before as I had noticed on the AT-588UV that if you don't have the cables connected and your radio on BEFORE you load the software you will get an error. But the way my screen was a jumpin' around I was afraid something evil was about to overtake my life.

Thanks again & again,

John

You too !

Looks like they made some changes to this software. Not sure if I want to download it to my radio or not as it states that it's for BFB291 or newer. Comm ports have been increased to 16 but the Options Menu has the same odd stuff and Save As still not working. Of course they didn't fool me with the ???? ???? ???? ???? as I'm on to them now.

Jim,
Confirmed... Plugged the cable in and it came right up.

Thanks,
John K3NXU

Topic: 8737 Message: 8737

The UV-5R cant work on the Australian UHF CB Radio Repeaters in Tasmania at all for some unknown reason
Where I am I can get R6 which is 476.550 RX and 477.300 TX and even with the 88.5 tone it wont work,Transmission goes through and theres no RX on the radio but yet on another radio theres no audio but when the 1st radio is done transmitting through the repeater all you get is a single beep and thats it and another thing to add CHIRP cant program a UV-5R either

it's called a balun (stands for balanced/unbalanced) and it's a device to match an unbalanced feedline to a balanced antenna.
IE, coaxial cable to a balanced wire antenna, or coaxial cable to balanced feedline such as latter line or twin lead.
No idea why you would want to use any kind of balun for UHF?
you can make one out of coax...simply make about 6 turns around a form perhaps 2 or 3 inches across in a coil...that will give you a coaxial balun that will work for whatever it is that you are trying to do.
there is no such antenna as a long wire for UHF that would be feesible or practical or efficient or any of that.

what is it exactly that you are trying to do here? I think you might be confused as to what you need.

your wrong on both counts.
The uv5R works perfectly well on australian UHF CB frequencies.
And, chirp programs the UV5R just fine.
But, as has been said quite a number of times since you've been on the list, you have to use the daily build and not the most recent stable version because the last officially released version of chirp doesn't support the UV5R.
use the chirp daily build link from either miklor.com/uv5r or from the chirp website.

Please don't make sweeping generalizations of how the uv5r does and doesn't work when there is overwhelming evidents both in the archives of this list, and in the files area of the group that prove you wrong.
Try downloading the australian CB frequency file from the files area of this group and using the latest daily build of chirp, and upload it to your radio.
I'll bet dollars to doughnuts that it works fine into the repeaters after you load that file into your radio.

8740. What Is Meaning And Function Of ANI Code?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-25 03:14:48 UTC

Topic: 8740 Message: 8740

Hi:

I am getting my BAOFENG UV-5r back from service check at Import Communications. Ed gave the radio a good bill of health including transmit, receive, flashlight, and FM tuner. He did note, "I can't find anything wrong with it. It was set to send some kind of ANI code (or something similar) at the end of each transmission. I turned that
off."

I don't know how that happened but would like to find out so I can avoid doing that again.

Thanks, and 73!

Automatic Number Identification

Automatic Number Identification or ANI, is a scheme that uses selcall for identification purposes. Typically a mobile radio will be configured to transmit a preconfigured selcall sequence when the user presses the ‘ push-to-talk <http://en.wikipedia.org/wiki/Push-to-talk>’ (PTT) button, which will automatically identify them to other devices listening on the same frequency on the radio network.

There are two ANI schemes; leading-edge and trailing-edge. Leading-edge ANI will transmit the selcall sequence as soon as the user presses the PTT button. Trailing-edge edge ANI will transmit the selcall sequence as soon as the user releases the PTT button.

Some selcall implementations use the last digit in the selcall sequence to signify some sort of status or condition, for example emergency or duress. Both transmitting and receiving devices are configured such that they attribute the same significance to each of the status codes. Often a device that decodes a certain status can display a predefined message to alert the user.

Together, ANI and status provide a convenient way to rapidly relay information via the radio network, without the user having to speak. For example, an ambulance paramedic in the field, having encountered some emergency, can simply press and release the PTT button on their radio to signal their predicament to the base. The ANI will identify the caller, the status code will indicate the scenario and the base can dispatch assistance as required.

Eric, we tested (out on the road into an area repeater) the NA-701, NA-666, against the Baofeng stock antenna. Both Nagoyas were better than the stock antenna, with the 710 the clear winner.

Recently we obtained one of the "$3.79 antennas" and while it was much better than the stock Baofeng, not quite as good as the NA-701. At the distance and conditions were were testing, the "$3.79 antenna" had a trace of crackle, I was told, whereas the NA-701 was full quiet.

I no longer have the NA-666, so can't tell you which was better, the 666 vs. the $3.79, but our impressions were that the $3.79 antenna was closer to the 701 than to the Baofeng, and it was clearly a great value.

We haven't checked the NA-771.

These tests weren't done with test equipment, but rather driving down the road and talking through the repeater, swapping antennas, driving another mile or two, same thing.

So, no fancy test gear. On the other hand, it was real world conditions.

Thanks Paul.
Very Cool. I don't have to spend any money then :-)
I wanted to go with whatever worked the best. The $3.79 antenna does sound like a good deal though. I may get one or two as a back up. First though I think I am going to get another UV-5R to keep in my office at work.
Have a good evening and thanks once again.

Theres no problem with programming a UV-5R or running the software on Windows 7 x64,You've got a hardware/software issue,I only run Windows 7 x64 and the only problem I've ever had is CHIRP but everything else works fine and Windows 7 has a known issue with serial ports,Theres a nice programming cable I got from ebay and its a PL-2303 and it works excellent and on COM3-COM4 and its like $10 with free postage and if your wondering its the usual USB-RS232 adapter built-in into the USB end of it

Why are you playing with tones? They are not part of the Aus CB
specification and should all be turned off. If you have a receive tone
set, you will be waiting an awfully long time for your receiver to
respond to a signal from the repeater, because it isn't going to send
the tone needed to let you hear it.

If anyone wants to run XP for some unknown reason theres VMWare and VirtualBox,you can downloads VMWare from www.isohunt.com with a crack and VirtualBox can be downloaded on here from the File section and that will support multi-core CPUs etc

Topic: 8720 Message: 8750

A balun is not a tuned source. It is not a source at all. As explained earlier today, it is merely an impedance matching device, if you like a type of transformer. It transforms the impedance on the secondary side to something close to your radio's 50 ohm impedance at its output.

A balun is not a universal magic bullet. To make one work, you need to design it in the knowledge of the impedance of the antenna you are trying to match to. At this point of you don't have that information, because you haven't selected an antenna type, setting aside your earlier reference to long wires, which as has been explained to you, are not applicable at UHF.

You would be better advised to take a published antenna design that is known to work and copy it. Chances are it will be close to the low swr you are seeking. If not, then you need to get hold of a swr bridge that will cover the frequency in question, or better yet, an antenna analyser. How do you get hold of one? You get in touch with somebody who has one and is prepared to lend you one, or even drop around to measure the antenna for you. Where do you find such a person? Why at your local radio club - dare I say it, such as REAST in Hobart.

8751. UV5R with iPhone headphones

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-25 09:13:41 UTC
From: gingergrowler
Topic: 8751 Message: 8751

OK this might sound like an odd request for help but I'm trying to get a set of iPhone headphones (with the built in microphone) to work with a UV5R.

I have dismantled the headset that came with the UV5R and attempted to wire up the dual-plug connector from the HT to the headphones.

I'm trying to create a converter jack socket that means I don't have to hack the headphones.

I understand that there are some tiny resistors in the headphone controls which allow the buttons to control various aspects on an iphone / ipod.

I've managed to get the headphones to work and to get the radio to key up. But I can't work out how to get the mic to activate at the same time as keying up. I can get the mic to key up and work but it's an open circuit so the mic is open constantly even when the button on the headphones is not pressed - so no good there!

I've got everything connected to a small bread board and I think I need to insert either some resistors or possibly a cap somewhere.

Phew...

So has anyone else tried this with any success or would anyone like to help me crack this one?

I do a lot of work where a normal radio head-set would look out of place, but I could get away with a pair of Apple headphones.

I've already spent a few hours trying to work this out but my brain hurts now!!!

Cheers,

Aubrey

You can only use packet for iss contact, and you might get a few minutes to do it in, I work satellite on my other radios and even the voice variety can be hard at times.

The PTT switch in my radio died and required replacement. The switch appears to be part number TL-3330-A-F130-Q-G, which is a 130 gram switch. If you replace with the 260 gram switch, it will make the PTT slightly harder to push by accident (which is what I did). Part number: TL-3330-A-F260-Q-G

I ordered from Mouser electronics since they had no minimum order.
http://www.mouser.com/ProductDetail/E-Switch/TL3330AF130QG/?qs=%2fha2pyFadug%2f5eXaN%2fmwYYM8CsQqiHmOK0fSrytk4mIYhyeXe%252boExg%3d%3d

Topic: 8752 Message: 8757

For Stu it is an ISS (International Space Station) app. It says it is a detector but the orbital path of the station is predictable. If the app knows your location and local time it can warn you when the station is passing over.

For us hams we like to use digital modes and voice to communicate to and through certain satellites.

Hope this helps. I remember being a newbie. All the jibberish will fade away. One day in the not-too-distant future you are going to have a ham conversation with someone and you will get "The Look". You too will speak jibberish.

Andy

Not true that the ISS is packet only. A lot of astronauts are licensed hams and occasionally an ISS astronaut will find some free time to work voice contacts. They also set up with schools and have hams assist letting kids talk to astronauts.

Haven't heard them yet, its pretty infrequent but I've heard there's a huge pileup when they do talk. They use NA1SS I believe over North America. Frequencies are a little different in different regions due to band allocations.

Also you can use AMSAT http://www.amsat.org/amsat-new/index.php on your computer or the Orbitron site http://www.stoff.pl/ both have a wealth of information I also have a couple of apps on my Thrive that are also great fun, Satellite AR and Google Sky Map.

I have not yet been able to hit a Sat. with the 5R have to get back to my Winter QTH and my shop to build a beam.

Enjoy,

JL

I've got it on my Android. It uses the info from heavensabove.com and I
find it doesn't always agree with calsky.com .

It is packet only UNLESS you are some kind of establishment like school or perhaps scientific organisation with a pre-arranged time, astronauts on iss are too busy doing other stuff to chat to hams, and if you think this is false, keep listening on the downlink,(you'll get bored tired or both) there may be odd comms to ground control, but not in ham bands or essential voice would be jammed with people trying to work iss in the hope of a qsl card.

Not true that the ISS is packet only. A lot of astronauts are licensed hams and occasionally an ISS astronaut will find some free time to work voice contacts. They also set up with schools and have hams assist letting kids talk to astronauts.

Haven't heard them yet, its pretty infrequent but I've heard there's a huge pileup when they do talk. They use NA1SS I believe over North America. Frequencies are a little different in different regions due to band allocations.

They do rarely call cq. It is a pileup. Depends on the crew and if they
have any free time.

8770. UV-5RA water resistant IP65

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-25 17:45:10 UTC
From: gmrs@pub.soohoo.org
Topic: 8770 Message: 8770

I've been watching ebay the last few weeks and witnessing the explosion of different variants of the UV-5R radio.

The one that catches my eye is the UV-5RA (see ebay item 310451910613) because it is IP65 water and dust resistant. Correct me if I'm wrong, but none of the other UV-5R variants has an "IP" rating.

What is IP65?

IP = Ingress Protection Rating

6 = 1st digit = Dust tight (No ingress of dust; complete protection against contact)

5 = 2nd digit = Protected against Water jets (Water projected by a nozzle (6.3mm) against enclosure from any direction shall have no harmful effects.)

I think perhaps you are wanting a UHF tuner, not a balun.
there are UHF tuners, but it makes little sence to use one because you can generally build the antenna close enough to specs to have it resonate properly without a tuner.
They use tuners on HF, because often HF antennas are multi-band antennas, and are not tuned, or necesarily resonant on any one frequency.

Hey all.
I have a question.
I have been having the same trouble with my charger. It takes forever for the charger to go Green. The first charge when I got the UV-5R, it only took a little over two hours. I used it for a while and that night I went to sleep with it on. The next morning I woke up and the battery was dead. I tried charging it. I had it in the charger for about 4 to 5 hours and it still was red. I was worried about overcharging the battery so I took it out. It seemed to work good and never got hot, then about 24 hours later it started to yell at me "low battery". LOL. I didn't know that it did that. Nice. the 3ed charging was the same as the first. No green light after 4 hours. Finally I did it again the next day but was determined to keep it on the charger till it went green. I put it on the charger around 6PM last night and around 3AM this morning when I went to go to bed it was still red. I figured I'll leave it charging till I got up but decided to turn the HT power off. I like to listen while it charges. Wow. When I turned the power off on the UV-5R the green light came on. Could it be that you have to charge the UV-5R with the power off?
What my question is, is how many of you are having trouble charging the battery with the power on? Have you tried charging the battery with the power off on the UV-5R to see if it charges correctly?
Yes. I know it is going to take longer to charge with the power on but I wouldn't think by many hours. My Yaesu VX-7R didn't take all that much more longer to charge with the power on. Just a thought.
I am still thinking about getting the TYT charger just in case. The charger that I am using now may turn out to be OK but I think the TYT may make me feel better for the future unless this is how the Baofeng charger is supposed to act.

8775. Re: [baofeng_uv5r] UV-5RA water resistant IP65

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-25 20:30:30 UTC
From: Peter Linss
Topic: 8770 Message: 8775

I seem to recall IP65 being mentioned on various sites when I purchased my UV-5R a few months back. I'm not sure how accurate that is, but I strongly suspect that the UV-5RA is a cosmetic change only. If the A is IP65 rated, then I suspect they all are, to whatever extent you can trust that rating.

That said, I've certainly exposed mine to a lot of dust and some water*, and it's none the worse for wear. I wouldn't take it scuba diving, but I'm not afraid of it getting wet in the rain or dropped in the dirt.

Peter

* It mostly lives inside the tail section of my motorcycle, which has since travelled a few thousand miles and crossed a flash flood wash out in Arizona with about a foot and a half of muddy water (fine silt). While the radio wasn't submerged, it did get it's fair share of mud exposure, as did every other nook and cranny of the motorcycle...

Hi,

It is not a good idea to run your radio while it is charging.(7.2.2) of the manual (?) states that. Also if you would read http://batteryuniversity.com/ about Li-ion batteries it will explain this type of battery pretty well. I suggest that you get a second battery to use while one is being charged. My battery stays works for several days, mostly listening.

Eric, the instructions say do not have the radio turned on while charging. I have noticed leaving the radio on does alter the charging time. When I first got my UV-5R I put it in the charger and started charging the battery (with the radio turned off) . After4 hours I was a bit concerned about the time it was taking so I took it out and used it for the next 2 days until I got the " Low Voltage " alarm. I then put it back into the charger in the morning (so I could keep an eye on it) and let it go to see if the charger would switch off or not. It took just under 6 hours to charge and it switched off by itself. I put my radio on charge this morning about 2:15am and here it is, 8:00am and it is still charging. I think a fast charger it is not. And once I left the radio turned on whilst on charge and it was still charging over 8 hours later. I was told once by a broadcast engineer who ran his own Radio shop never leave a walkie talkie turned on when on charge as the switching voltage from the charger can damage the radio (and the battery doesn't " quench " all of the noise/spikes from the charger)

Hope this helps Eric,

Cheers

Rob.

From: Chris Ruhl
Topic: 8780 Message: 8780

My Nagoya RA-701 showed up from Hong Kong in less than a week!

I immediately noticed a good, clean package (not cheap vinyl) holding the antenna, correct and crisp "Nagoya" emblem, along with a hologram "Nagoya" sticker. I immediately gave it a test with the antenna analyzer and it hit "dead on" in the 2m repeater range, 1.5:1 SWR range. Nice! I get the impression that some of these Diamond fakes are otherwise good commercial band antennas, just lousy on 2m in the USA at least.

I like to use my UV-5R as a receiver for marine, railroad, NOAA weather, and the like, as well as amateur bands. I do NOT want to even accidentally transmit on these frequencies and I found out today that "Chirp" has a not-so-obvious way of making sure no RF gets out on these "monitoring only" frequencies, shown below in case it might help somebody. . .

Enter the desired receive frequency.
In the Duplex Field, select SPLIT
In the Offset Field, enter 0.0
000.000 will display when transmitter is keyed. No RF is generated.

I still get a red background, but they tell me that no RF is being generated in spite of that.

Cheers,
N3GBJ

Subject: RE: [baofeng_uv5r] Re: Charging indication

Eric, the instructions say do not have the radio turned on while charging. I have noticed leaving the radio on does alter the charging time. When I first got my UV-5R I put it in the charger and started charging the battery (with the radio turned off) . After4 hours I was a bit concerned about the time it was taking so I took it out and used it for the next 2 days until I got the " Low Voltage " alarm. I then put it back into the charger in the morning (so I could keep an eye on it) and let it go to see if the charger would switch off or not. It took just under 6 hours to charge and it switched off by itself. I put my radio on charge this morning about 2:15am and here it is, 8:00am and it is still charging. I think a fast charger it is not. And once I left the radio turned on whilst on charge and it was still charging over 8 hours later. I was told once by a broadcast engineer who ran his own Radio shop never leave a walkie talkie turned on when on charge as the switching voltage from the charger can damage the radio (and the battery doesn't " quench " all of the noise/spikes from the charger)

Hope this helps Eric,

Cheers

Rob.

Subject: [baofeng_uv5r] Re: Charging indication

Hey all.
I have a question.
I have been having the same trouble with my charger. It takes forever for the charger to go Green. The first charge when I got the UV-5R, it only took

a little over two hours. I used it for a while and that night I went to sleep with it on. The next morning I woke up and the battery was dead. I tried charging it. I had it in the charger for about 4 to 5 hours and it still was red. I was worried about overcharging the battery so I took it out. It seemed to work good and never got hot, then about 24 hours later it started to yell at me "low battery". LOL. I didn't know that it did that. Nice. the 3ed charging was the same as the first. No green light after 4 hours. Finally I did it again the next day but was determined to keep it on the charger till it went green. I put it on the charger around 6PM last night and around 3AM this morning when I went to go to bed it was still red. I figured I'll leave it charging till I got up but decided to turn the HT power off. I like to listen while it charges. Wow. When I turned the power off on the UV-5R the green light came on. Could it be that you have to charge the UV-5R with the power off?
What my question is, is how many of you are having trouble charging the battery with the power on? Have you tried charging the battery with the power off on the UV-5R to see if it charges correctly?
Yes. I know it is going to take longer to charge with the power on but I wouldn't think by many hours. My Yaesu VX-7R didn't take all that much more longer to charge with the power on. Just a thought.
I am still thinking about getting the TYT charger just in case. The charger that I am using now may turn out to be OK but I think the TYT may make me feel better for the future unless this is how the Baofeng charger is supposed to act.

I've got a homemade HF Antenna Tuner and they are useful cause you can tune a good variety of wire and trees but UHF is better in a way cause its smaller wire lenghts etc and the ground plane is alot smaller but the SWR part is a pain,Btw theres antenna analyzers on ebay for VHF and UHF but VHF is cheaper and UHF start at about $500 which I dont have:|

I purchased a UV 5R at a hamfest a month ago and programmed it no problem with the USB cable I bought on EBAY.

I just purchased 2 directly from China and I cannot program using either Chirp or the BAOFENG software.

It tries to upload, but then just bounces out and stops.

I am SOOOOO frustrated. What am I doing wrong??
I am on Windows 7 64 bit.

Thanks.

Turn on the radio at the same time push #3 button. Recent updated firmware requires updated software which you can download from here somewhere, there are links to it. If your firmware is above BRB251, definitely you will require the updated software to program your radios.

Typo in the last post.
If your firmware is higher than BFB281, the new software is required.

Does anyone know of or now if its possible to modify a groun independant base from a 850MHz 3G antenna,I've got 1 and you can take out the antenna and cut it down if you like cause it screws onto the base and its got 2 loading coils and by the lenght you could make a 1/2 antenna with the top coil for UHF

I doubt it would be worth your while when you can achieve the same result
with a small length of RJ58CU coaxial cable

Yes Pit bull you could modify the antenna and base,

What you would need to do is to trim the antenna to the resonant frequency you need and then retune the ground plane independent base to the new whip..

The question is how well it would work and is it really worth it when you can start from scratch and with a lot less effort make something that is known to work.

Cheers,

Rob.

Hello All!!!

New to the group here. I recently purchased a few AAA battery cases for my UV5R radios from a vender in China. I can't seem to get the battery cases to lock on to the radios. The upper portion of the battery case will click into position but the bottom will not engage the retaining tabs on the lower part Of the radio housing. I've contacted the seller and he assures me it is the correct case made for the UV5R and it does look to be. I believe a saw a post here a while back where someone else had the same issue . Has anyone else purchased on of these AAA battery cases for their UV5R's? What is your experience hitch them?

Thanks & 73's

Roger

uofa1978,

Be careful as this radio can transmit on many frequencies that you may not be authorized to use or at powers not allowed on that frequency. Your radio itself needs to be approved for use in various areas over the spectrum also.

I had a feeling that the ground plane would need to be adjusted and it would be too much to get it apart as its a telstra antenna and what I gathered it must be glued aswell

However keep in mind the UV-5R is not technically legal to use on any GMRS frequencies. While it is Part 90 certified, it is not Part 95 certified as required for GMRS. Now with that said I know many use these for GMRS and probably will never have a problem. Use at your own risk.

N3GBJ, if you are running the latest daily build of CHIRP, in the duplex field, select "off" and it wont let you xmit on that channel. The radio wont light up (lcd wont go red, xmit button stays off), and it chirps letting you know it is rx only. Feels better to me for some reason lol.

Roger,

I have a AAA battery case that Ive recently purchased as well. I do have the same problem as you in that the top of the batttery case clips in very easilly but the bottom kicks out and wont engage the tabs. However, I have been able to get it to clip into the radio fine, if you put batteries in the case (must flex something somehow a bit ??) and put a fair amount of even pressure on the back battery case whilst sliding it into position. It doesnt lock 100 percent of the time either, unless you give a reasonably sharp push.
Theres probably a spot or two on the case that could be filed down to make all this a lot easier. I havnt looked at it closely enough yet to determine where on the case yet.

Regards .. Andrew

has anyone done an SWR sweep chart for this 3.79 antenna?

I will have one eventually, but the tech who has the equipment to create the

digital print out of his results has been out of town since I bought the

j0125As.

Another tech I know checked one of my antennas, but his results were not

congruent with all the info I have read on this list about the antenna.

I may have gotten a non functioning antenna...so I'm going to have him check

the one I've been using with great success for the past couple

weeks...supperior to the stock antenna on VHF and UHF for sure from what i

can tell.

I got mine for $48.69 on Amazon. At that price if it breaks take the battery off it and the belt clip and the antenna and chi.k the radio and buy another one. It is not coat effective to repair a radio at that price.

Wally

Chris Ruhl <cdruhl@comcast.net> wrote:

What is the feeling overall on the "aftermarket" warranty offered by e-Bay on these radios, typically costing about $8 USD or so? Boafeng lists a warranty in the manual but only if stamped and dated by the dealer, with a note saying, "Best buy from local dealer."

As one other chap found out with Radioshop888, one can be very well "on their own" and have nothing.

Most guys in my ham club have bought these Baofengs with the idea of them being $50 disposable radios. They carry them in harsh areas, on their bicyles, figuring if it breaks, they're not out a $200+ Icom or Kenwood or whatever, which is their primarly HT (especially if they are into D-STAR). When my UV-5R came, I was very much impressed with the quality physical construction, the overall "feel" of the radio, and I found out that it rivals more expensive radios with actual performance. The guys in my radio shop at work were dumbfounded by the quality for the price, most thinking that the radio cost considerably more (3 to 4 times as much) than it actually did. Thus, there is a strong temptation, and feeling, to see this radio as a more expensive model. Yes, the programming can be funny (they call are) and the TDR functions on the Baofeng can be annoying when compared to a Wouxun but I purposely kept the Wouxun out of service and gave the UV-5R a good run. Once one gets
over the "humps" and sees how basic everyday usage (like TDR off and on, power levels, etc.) can handed with menu and keypad, this could be a nice starter radio for a new ham on a very limited budget, particularly high school kids. I know a school teacher who has purchased a large number of these radios for school club use. So long as you keep transmissions reasonably short, and don't get too long-winded or talk for hours, it's a good way to help get kids into the hobby and not risk busting an expensive radio.

I use mine and both a ham radio and a scanner, and it is a decent receiver, even on some of the public service frequencies in the 502.000 Mhz range.

All that considered, I would love to see better handling of sales and warranty issues, perhaps local dealers like with the Wouxuns. But, then again, the very cheap cost of these things comes with a tradeoff. For about double the cost you can have the comfort of a local dealer return policy with Wouxun. The other big issue seems to be fake components from "no name" e-Bay sites in China. Put "Fake Diamond Antennas" into any browser search and you'll find at least three hits. Somebody I know thinks that they got a fake $3.99 Nagoya RA-771 as well, or poor quality control such that the antenna had a SWR of almost 20:1 at 146.000 Mhz. Considering that a fake antenna could damage or shorten the life of these radios, I only buy HT antennas from known, good sources (HRO, AES, others here in USA). Meanwhile, you have an antenna that may work for a scanner but possibly not much else.

As for poor solder joints and such, anybody who has obtained a quirky item from MFJ here in the states knows much about that! The flimsy Baofeng charger, though, doesn't seem to match the radio as far as quality goes. Mine acts quirky as well. I may open it and check it for solder as well.

8844. GMRS setup

Okay..I am a newbie with 3 UV5R radios wanting to use them for family communication on GMRS...have the family license and have tuned each radio to 462560 and they are not "speaking" to each other.

In looking at the GMRS frequencies, they have more numbers than this radio can input and I am wondering if that is the problem...

Also...GMRS can use repeaters and while there are none in South Denver there is one in Denver proper....how do I access them.

Thanks and if someone can point me to an "Elmer" lesson, it would be greatly appreciated.

Thanks for any advice.

Regards

John

John,

Using the OEM software I have been able to program that frequency with 4 decimal places. I can't enter 4 places via my keypad. When you do it via software there is a very, very small "5" to the right of the freq. 462.5625 .

As for the rest of the set up I wiould treat it as a Simplex Frequency, refer to the Miklor site for those details.

I'm sure that you are aware that these radios are not certified to be used on the GMRS band. At this time I think they have only been certified for Part 90 & Part 95..... may or may not be an issue.

Hope this helps,

John

Subject: [baofeng_uv5r] GMRS setup

Okay..I am a newbie with 3 UV5R radios wanting to use them for family communication on GMRS...have the family license and have tuned each radio to 462560 and they are not "speaking" to each other.

In looking at the GMRS frequencies, they have more numbers than this radio can input and I am wondering if that is the problem...

Also...GMRS can use repeaters and while there are none in South Denver there is one in Denver proper....how do I access them.

Thanks and if someone can point me to an "Elmer" lesson, it would be greatly appreciated.

Thanks for any advice.

Regards

John

The UV-5R can be programmed from the keypad up to 5 decimal places depending on the STEP amount that is selected. In this case...

- Set menu 1 (STEP) equal to 2.5K (12.5K should also work)
- Then key in the frequency as close as you can get it
- Then use the [UP]/[DN] arrow keys to adjust to the correct frequency (notice the 5 will appear at the right of the main frequency display)

A STEP of 6.25K will allow '25' and '75' to appear to the right of the main frequency display.

hi,

i have one and use it at home at my regulated power supply, which gives out 13.8v. i fire it up in the morning and shut it down at night: no problems at all. the eliminators sticker on its back says it will handle up to 40v input, so i think i am safe with the 13.8v. my eliminator fits the '5' like the original battery. all colours available at ebays PRORADIOSHOP; good for me to run with my yellow rig. ;-)

I think you should be able to get to the .5625 frequency by setting the channel step to 6.25, or 12.5 should work as well. If it's set at 2.5/5/10/15, you may not, but set to 6.25 and type in the digits as far as you can and the radio will round up to the nearest step.

set the channel step to 6.25 and no joy...same with trying to input the frequencies in the Baofeng software.
As an aside, there are multiple channel shares with GMRS/FRS that have a max of 5 watts....these are 4 watts so I believe there should not be a problem.

Would love to try chirp, but the daily build does not seem to work for me. Windows 7 64 bit.

Any other suggestions..

Today I did some field tests using two UV-5R
-one with stock antenna and 3600mA battery,
-the other with 3.79$ antenna and 1800mA battery.

Communication was OK for about 2km line-of-sight.

At 2.5 km the one with stock antenna cannot be heard at all by the other one, while still clearly receiving it.

At 5.2 km I was still able to hear the one with 3.79$ antenna, but with a lot of noise. The speech was intelligible.

At 5.5km there was mostly noise.

The frequency used was 434.700 MHz LPD66 with maximum power. :D

John,
My guess is that you are trying to program the UHF frequency in the lower display. All programming has to be done in the upper display.

I entered 462.5625 in my UV-5R just fine with step set to 2.5K. I'm sure the OEM software will work as well. I don't have access to it right now but I think that to get some of the cell to 'take' what has been entered into them you should avoid hitting enter and just click into another cell. Give that a try.

What's going on with the Chirp daily build, are you getting an error
when you launch the application?

I have the MURS, GMRS, and FRS frequencies (at the proper power levels)
programmed into my UV-5R - and the GMRS frequencies work well
communicating with my Midland GPX units. I did use Chirp, however.

Also, do not have the radios right next to each other. The receiver front end on the 5R can be a little touchy, so if you have them to close to each other, it may appear they are not working. A few feet apart should be all that is needed.

There are web sites that will give you the PL tones for the privacy codes too. Just Google GMRS privacy code. You can then set the CTCSS codes. But don't do that until you have them working without CTCSS (walk before you run kinda thing).

And everyone is correct, these radios are not certified for GMRS, although there is no compelling reason I can find for why they could not be. Some GMRS sites I found stated their interpretation is that as long as the radio meets or exceeds the technical requirements for part 95 that they can be used. But they are quite illegal for FRS (Antenna, power, certification, etc)

Is there someone on the list that has dug into this further? Does the UV-5R meet the technical requirements for part 95 if configured correctly and is just not certified?

RD

Hi all

Can anyone tell me what the difference between the uv-5r+plus and the uv-5rE, or indeed comparing them to the standard uv-5r, I already have the early one and wondered if there was any changes.

One thing I have found out is the firmware, 3 key BFB upgrade to BFB 281 (Old: BFB251)
Likewise the 6 key*VER-05 upgrade to 120724A (Old 6 key*VER-05: 120722A)

I know this is only numbers, but have they fixed any of the minor bugs, and which radio is the best to go for.

Cheers

Dave...

Number 1

Brand: Baofeng
Type: UV-5R
Colour: Black
Delivery Date: May 2012

Back sticker
Model: BF-UV5R
S/N: 201201R00091

Electronic information
ON + [3]: BFB230
ON + [6]: 1201002 VER-04
PSU voltage: 8.4
Voice: Chinese only

Remarks: UHF and VHF receiver off frequency
channel scanning doesn't stop on low CTCSS tones
audio volume cannot be all the way down

Number 2

Brand: Baofeng
Type: UV-5RB
Colour: Black
Delivery Date: September 2012

Back sticker
Model: UV-5RB
S/N: 1230001786

Electronic information
ON + [3]: BFB281
ON + [6]: 120724A VER-05
PSU voltage: 12
Voice: Chinese and English

Remarks: better lit keyboard than my UV-5R, BFB230 version
channel scanning doesn't stop on low CTCSS tones
flashlight can be off, on or blinking

I just received my 4000MHA battery from China. There is a socket on the side of the battery that I assume is for charging the battery. The plug on my AC adapter does not fit this socket. Does anyone have information on charging this battery thru its socket? - Jerry WA5KZA

I wonder if this battery would charge with the TYT TH-UVF9 charger? The UVF9 comes with a wall wrt type charger but no drop-in cradle. However,t eh Baofeng batteries also fit the TYT radio.

Radioshop888

I looked around at different E-Bay vendors, saw some Nagoya RA-771's but the picture showed a Diamond "RH-701" and so I avoided those. I saw a matching picture with Radioshop888 and took a chance. I ordered it on Saturday night and it was here to me in the USA on Thursday.

I had the UV-5R out in the field today with the RA-771 and it worked nice, even with some not-so-close repeaters.

As is always with radios and antennas and repeaters, "Your Mileage May Vary."

Thank you!

I'm with you there! I'd rather it give NO indication of showing RF going out!

I think I do have the latest version of Chirp Daily Build as I updated it yesterday, will check.

Chris

ok.
I took a few antennas to our club gathering yesterday and checked them on an MFJ 269 analyzer.
I know that using an analyzer doesn't give perfectly accurate results, but it does give some relative bench marks when testing various antennas of similar type.
I tested the uv5R stock duck, both j0125As (the 3.79 antenna) an MFJ 1715 and a wouxun ud1P stock duck.
I didn't chart the results, but I can give a fairly accurate run down of each antenna.
The uv5R stock duck showed about a 2.3 to 2.5 to 1 swr between 144 and 148MHZ. it dropped a wee bit to about 1.9 at 150MHZ. It was around 2.2 to 2.5 to 1 from 420 to 450MHZ.
Outside the ham band on VHF the swr was way above 3 to 1, and above 450MHZ it was 6 to 1 or greater.

The first 3.79 antenna I tried yielded SWR of about 2.2 to 1 across the 144 to 148mhz ham band, and around 2 to 1 across the 420 to 450UHF band. The second 3.79 antenna I tried had a lower swr on VHF of about 2 to 1 from 144 to 146.5, and dropped to a 1.6 to 1 above 146.5 to about 148, then jumped back up to 2.5 to 1 and on up above 150MHZ.
The mfj 1715 showed around a 2.4 to 1 match across the VHF ham band, and about 3 to 1 across the UHF ham band.
The wouxun stock antenna was well above 3 to 1 on both the VHF and UHF ham bands, with a bump to about 5 to one at 440mhz.
We didn't use any kind of counterpoise or ground plain on the 269, but we checked to see if there were any alterations in swr or impedance when we held it, or set it on the table with no one near the unit...there didn't appear to be any changes in either state.
As I said, the 269 isn't a presision instrument by any stretch of the imagination, but our results seemed to be consistent across all antennas, and we checked them each at least twice.
So, at the end of it all here is the summary:
the wouxun stock antenna had the worst swr. Next the MFJ 1715, next the stock uv5r duck, then lets call it the j0125#1 and the best was the j0125A #2.
none of them yielded great swr on either VHF or UHF, except the j0125A #2 which dropped slightly in the upper portion of the VHF ham band.
the impedance varied between 48 and 52 ohms on all the antennas, and was erratic enough that I can't give accurate results.
So, my impression is that the j0125a, while not a perfect antenna, did yield better swr results than the other 3.
take the results with a big fist full of salt due to the instrumentation and circumstances.

has anyone done an SWR sweep chart for this 3.79 antenna?
I will have one eventually, but the tech who has the equipment to create the digital print out of his results has been out of town since I bought the j0125As.
Another tech I know checked one of my antennas, but his results were not congruent with all the info I have read on this list about the antenna.
I may have gotten a non functioning antenna...so I'm going to have him check the one I've been using with great success for the past couple weeks...supperior to the stock antenna on VHF and UHF for sure from what i can tell.

Here is a blog that compares the $3.79 antenna to the the Wouxun and Quansheng antennas.

http://hamgear.wordpress.com/2012/07/10/the-3-79-antenna-review/

The $3.79 antenna is the one I currently use on my UV-5R.

Pit Bull
SMA RP antennas are not compatible with the UV5R.
The RP stands for Reverse Polarity.
The outer shell may look the same, but the Male/Female pin
sequence is reversed.

8877. Re: Field Programming Question

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-26 21:51:39 UTC
From: Richard
Topic: 8514 Message: 8877

Some interesting observations. I recently tried a similar experiment with a 259 analyzer and the Wouxun, 2 Baofengs (early and later issue), Nagoya NA-701, the $3.79 antenna and my stock antenna from my FT-60r. A notable difference was that the early Baofeng (an April UV-5r) was by far the worst of the lot for SWR. The August UV-5r stock antenna was much better. I saw some differences when I was close to an antenna vs. far away. That effect was the least with my stock antenna from the FT-60r. I found the Wouxun antenna to be in the general ball park with the others (early baofeng excepted).

Amen to the comment about the fist full of salt.

I think I might just stick to using a bolt as a antenna base and trim the antenna,Pity the base is useless

Lets just do what the radio operators used to years ago and tune a tree,soo much less crap involved,more variety,doesnt need to come from hong kong or china and the SWR is set by the user

You do NOT want an RP-SMA anything. Avoid anything that says "RP"--it is only used for WIFI equipment and not HTs.
It's the center pin that determines gender. The UV-5R has an SMA male connector, which is the opposite (I won't say "reverse") of the "Japanese standard", and therefore requires an SMA female connector on the antenna. An SMA female connector screws "in" to the male, but has a receiver for the gender-determining pin. Confusing enough just there.
"RP" is something completely different, just to make the world a really crazy place. The males of this persuasion have no pin, the females do. (You can make up your own jokes,...)
Anything specifying "RP" is not ham-compatible.

Do you know if theres any decent RP-SMA antennas at all that have a good SWR on the UHF range for the UV-5R's or is what I say and just use a seperate antenna for each band,OR do the Kenwood antennas have a good SWR

The UV-5R's charging base has regulating circuitry for proper charging of the battery. Even if you were to change to the proper plug to fit your new 4000 mah battery, you would not want to plug the UV-5R's "wall wart" directly into the battery.

As John said, RP-SMA and SMA-Female are not the same.

RP-SMA connections/antennas were designed specifically for wireless routers so that regular SMA, either male or female, cannot be interchanged with the router's antenna. Wireless routers, in the USA, work around 2.4 GHz, and those antennas are unsuitable for the UV-5R's frequencies.

the current thread on rp-sma connections is germane because i went off on a tangent and wasted $20-30 ordering these because i had gotten confused.

anyway, i ordered two sets of adaptors from the link @PhotoHam supplied and while they no doubt took that legendary ' slow boat to [from] china' to get here, the arrived nicely packaged and even sporting tiny cute little plastic protective caps. here's the link again in case you don't want to dig for it below:

http://www.ebay.com/itm/150533113907?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1439.l2649

someone else on here (paulc maybe?) said they placed an order around the same time. if you're reading this, did your order come in?

I want to pick up 1 or 2 Nagoya na-701 antennas from ebay because I've heard so many great reports from people who use this particular antenna.
I see some drastic price differences though.
I see around 13 bucks and change quite a bit, but I also see 6 bucks and change. Both with free shipping.

Should I assume these are going to be the same antenna? Is the big price difference just due to the seller, or is the 6 dollar Nagoya 701 a different antenna than the 13 dollar one?
I thought perhaps someone on the list might have some insight into this...and I figured I'd ask before I pull the trigger on the cheaper one.
I don't mind buying the 13.xx one if it's the real item, but if they are both the same antenna, I'll buy the cheaper one.

in partial answer to my own question, I compared and one major difference
between the two is that the cheaper one is 206MM long, and the other one is
216MM long.
Usually more money means an original or a better product. But this isn't
always the case with chinese products me thinks.

>

A 1/4 wave antenna on an HT or vehicle is half of a "half wave dipole". However, that single element by itself is not a "dipole". It is more properly a "monopole".

With single element, the 1/4 wave antenna is acting like half of the half wave, and the ground plane, the vehicle the antenna is bolted to, filing cabinet, pizza pan, or radial elements, create the other half of the halfwave dipole. Follow so far?

By providing that ground plane you create a more efficient dipole antenna.

So why not do that? Some do... and they call it a "Rat Tail" or "Tiger Tail". You can do this quite easily yourself with not much more than a piece of wire. Here is a video on how to make your own. Better than just twisting the piece of wire, you can attach the end of the wire, by crimping or soldering, to a ring terminal that will sandwich between the antenna and radio like a washer.

http://www.youtube.com/watch?v=0IZvay-cqHM

The 6-1/2" one is suited to 440 mhz (70 cm). The 19-1/2" will work for both 2m and 70 cm. (19.5" is three 1/4 waves)

Let's do the math. 234 / 445 mhz = 0.526 feet... or x 12"/ft = 6.3" or 160 mm.

For 2m, 234 / 146 mhz = 1.603 feet... or x 12"/ft = 19.236" or 489 mm.

I would measure the wire from where the ring terminal touches the base of the antenna.

The "rat tail" for 2 meters should work for 70 cm if you cut it a bit longer, so yes, 19.5" or 495 mm.

You may ask, why is the antenna supplied with the radio not 19.5"? Because it is not a straight wire inside, it is a coil. It is a "loaded coil" antenna that makes the transmitter happy, reducing length, at the expense of loss of efficiency.

And you should watch this, too. Interesting conclusion.

http://www.youtube.com/watch?v=phMTJKeieXA

I will point out that the "rat tail" costs almost nothing to try. I will also point out that a better antenna will make the most difference, just as this fellow said. And getting

any antenna up high will make the most difference, whether you stand on top of a mountain, drive over an overpass or bridge, or stand on your roof.

I once spoke to a friend who was 50 miles away via the mobile radio in my truck. He was using a 5 watt HT with adapters connected to the 2 meter beam up on his 50' tower.

I reported a little noise, a "shhhh" in his signal. He said, "Oh, hold on a second... How's this?"

I said, "Perfect, full quiet."

He replied, "I turned off the window unit (air conditioner) behind me."

Anyway, I will not say the longer the antenna the better. I will say the closer it is to a resonant 1/4 wave (a coil loaded antenna is resonant, too) the better. Any loading coils that are used to shorten the antenna will be to your detriment. So, you want something that is closer to that 19.3" (for 2 meters) or 6.3" (for 70 cm) than the stubby little antennas. The worst are those little suppository size antennas which are essentially a leaky dummy load.

Now this is easy to build:

http://www.hamuniverse.com/2metergp.html

I made one with brass rail from HO scale model train track. You could also use 1/16" brass brazing rod, or just some stiff 14 ga wire from Romex house wire. The solder joint to the center conductor of the SO-239 socket can be made quickly and easily. Cut that element long, and trim to length after soldering. Measure length from where the center conductor emerges from the insulator.

Make the radials 5% longer, as per the formula. Don't try to solder them to the SO-239 socket. By the time you get it hot enough you'll melt the insulator. And you still have three more to solder. Instead, solder small ring terminals to the radial elements, and attach them to the four screw holes of the socket with 4-40 screws, nuts, and washers. I'd add a drop of Locktite. Trim them to length AFTER attaching. Measure from the screw/nut out to the end. They should be bent down 45 degrees.

If mounting outdoors, put some Locktite on the insulator to help seal it, and protect your coax connection like this:

http://k9zw.wordpress.com/2010/05/12/guest-post-weatherproofing-antenna-coax-by-paul-ae5ju/

Hi Colin,

I run a Nagoya NA 771 which is about 390 mm long and it appears to work fine.

I have a mate about 1 KM away and about 60 ft above me and we talk on 1 watt to each other fine, unfortunately I don't have the gear to measure it accurately for return loss / VSWR etc.

Cheers,

Rob.

OK, thanks for that.
I don't want another, what I call, eye poker special...my mfj 1715 is 14 inches and that is too long to really be comfortable when the radio is on your belt.
I like the j0125a length at around 214MM...the na-701 seems to be 216 so pretty much the same relative length.
I know the longer the radiator, the better the results most of the time though.

Colin,
The $6.89 antenna would make me nervous. From the picture it looks like blue ink directly on the base of the antenna. My NA-701 came in a plastic sleeve with a Nagoya holographic authenticity sticker so I will assume it is genuine. The antenna has a black sticker at the base with silver lettering.

The cheapest buy-it-now price for an NA-701 that looks like mine is $13.50 and the seller is mega409shop. So I would skip eBay and buy it direct from 409shop.com. They take paypal and you will save $1.

Ok I did a search but did not find a answer to my problem plus my nerves are shot !! lol.

I am running windows XP installed the correct driver,
installed the correct chirp program.

But when I try to save to the file it tells me none is there.
I did create one in my documents but it will not save. anyone give me some help please!!
Thanks

try exporting as either a .img or .csv file.
not sure what you mean by you created one in "my documents" but it won't save.
When you have read the radio, you can save it as an .img or .csv file.
Or when you have read the radio, and edited all the information you can save or save as or export.

The 4000mah battery charges just fine in the base charger. It is just that it has that socket on the side and what came with the battery had no indication about what it is for. I do have a commercial charger designed to charge any LI battery so that is not the issue. Guess I will see if I can bug out the pins. Jerry WA5KZA

Colin,
Thank you for the fast reply! I thought I had to create a working folder to save all of my setting in? at the top of the file page it should have the name that I give it right? Sorry for newb but I am to good at the computer.So when I am done putting all of my setting on the page,what would be my next step so I can get this save or should I just send it over to the radio?

I have no idea what this represents. It seems to be a graph, but
neither axis is labeled.
So I have no guess as to what "information" is supposed to be presented.
Could clues be forthcoming?

You didn't say what software you are using so I'll have to guess that you are using the Baofeng UV-5R software.

The error you are getting is "Store the file name is nullity."

When you get to the 'Save File' screen, you have to enter a complete file name including the .dat extension. Example: MyFile.dat

Let me know if I guessed right. If not, I'll ask you some questions and we'll try again.

Good luck,
Jim KC9HI

The charger terminals, radio terminals and side socket are all connected to + and - all the time. So any LI charger for 2 cell batteries will charge it thru the side socket. - Jerry WA5KZA

Those are fairly straightforward SWR plots showing SWR vs Frequency. You can see the VHF (left) and UHF (right) resonances and best SWRs of the dual band antenna.

Jim, I have two Nagoya NA-701s. Both cost about the same, $13 and change from two separate reliable sellers on eBay.

Both came in the yellow plastic sleeve packaging. One has the black sticker with silver lettering on the base of the antenna. The other has blue lettering printed on the base. I've read elsewhere that both markings can be genuine Nagoya.

I, too, would be suspicious of the $6.89 priced ones.

I've bought from ebay sellers radioshop888, solidradio, and 409shop (aka "radiobank" on eBay). All have been on the up and up.

Both the silver and blue lettered antennas work equally well, are the same length.

Paul - AE5JU

The presence of a nice hologram sticker is no guarantee of authenticity.

The counterfiet hologram factory is right next to the counterfeit antenna factory in Shanghai.

I would add that I have GMRS/FRS radios from Cobra that are quite
nice and they are $20, not $45 like the Baofeng. So it's really a
matter of horses for courses, get the radio that does what you want
to do well. I will trade you your two Baofengs for four Cobras, and
we will both be happier. It's a matter of what fits your needs.

Hi Everyone.
New member here. Just received a uv-5re.
I noticed the speaker plug half of the ear/mic piece looks like a stereo 1/8? What would happen if I plug a mono 1/8 from an external speaker into the jack just for monitoring purposes?

It will likely happen. But support has to be reverse engineered from an actual UV-5R with BFB291 firmware. So the first step would be for someone to provide a loaner to the CHIRP development team to get the ball rolling. I'm pretty sure instructions for how to provide a loaner are on the CHIRP website.

The 1/8"[3.5MM] jack is the larger of the two jacks. Unless the cover is labeled wrong, I believe the speaker jack is the smaller 3/32"[2.5MM] of the two.

I think a 2-conductor (mono) plug will work in this jack for a speaker but a 3-conductor (stereo) plug is needed for making a programming cable (a programming cable uses the ring and sleeve).

Hey all.
I actually just ordered a few days ago one of each of the NA-771 and the NA-701 with the blue print at the base. Primarily for extras but I wanted to see what the difference was between the ones that I have now (both the 771 and the 701) with the black label and the silver print. One of the major things that I looked at before I purchased them was that for the NA-701 ($6.89 w/free shipping from "link-delight-eu") there was 68 sold and had a 98.8% positive feedback and the NA-771 ($4.98 w/free shipping from "abeyerr") there was 238 sold with a 98.6% positive feedback. I'll let the groupe know if there is any physical differences in the antennas. I'll also test the antennas on some repeaters when able.
I can tell you that today at work I could just barely make my repeater using a fully charged UV-5RC and the NA-701 but was readable. I then put on the NA-771 and I got real good signal reports and I was told I was full quieting in to the repeater. The Baofeng UV-5Rs original antenna that came with it didn't make the repeater at all. I don't have one of the new $3.79 Ebay antennas but when it arrives I'll try it too. Hope this helps.

the 771 is nearly, but not quite, twice as long as the 701. SWR aside, the longer the radiator, IE, the more metal in the air, the better the antenna will work typically.
It's probably a double 5/8's on UHF and close to a quarter wave on VHF.
odds are that it has a little bit more gain as well compared to the 701, so it's going to be a better antenna no matter how you roll the dice.
But again, the 771 is just that little bit too long to be comfortable when wearing the HT on your belt...it has more potential to be bent and break as well with that long whip on it.
It'll work better and is a good compremise to say a full sized dual band mobile antenna or something.

you are correct.
the smaller of the two, the 2.5MM jack, is the audio output.
looking at the speaker mic 2.5MM plug, it is a TRS, tip ring sleeve plug, or also known as a stereo plug.
So is the larger 3.5MM jack which is mic audio input.
You will have at minimum, PTT, audio in, audio out, and at least one ground, if not two grounds....one audio ground and one PTT ground.
Not sure if they are using the ring of the 2.5MM or the 3.5MM for PTT.
I'm going to make a guess because I haven't seen the schematic, that the ring on the 3.5MM plug is the PTT line....so you should be able to plug in a 2.5MM mono plug into the speaker output jack and use an external speaker without any issues.
The speaker mic I have has a 3.5MM headphone jack on it, and I've used an external speaker on it, so I know you can definitely connect an external speaker through the 2.5M jack, just not 100 per cent certain if you have to isolate that ring line and prevent it from shorting to make it work.
All you'd have to do if this is the case is use a 2.5MM stereo jack and leave one of the connections open and only use the two required for audio out.

can someone write a description of the pin out on the two jacks? in TRS terms.
this would help to clarify and explain exactly what is happening and what one needs to do to use an external speaker or external microphone etc.

Topic: 8919 Message: 8930

oh, as for what would happen? It would likely key the radio because your
mono plug's sleeve would short the ring of the jack to ground...that is
assuming the ring is the PTT line.
if the tip is the PTT line, then it might stil key the radio because the PTT
line probably needs less than 8ohms across it to engage.
all this is moot of course, if the PTT line is on the 2.5MM jack.

Thank you all for you replies! I do however have other ?

8932. Uploading to radio failed? It does not want to hold the radio info in the box.

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-27 04:12:36 UTC
From: bluesman913
Topic: 8932 Message: 8932

I will try to explain best I can.
When I try to upload to radio a box pops up asking of course for the com port. I do understand that,but it never has the correct radio info.It keeps going back to the vertex standard and the dropboxes are blanked out it won't let me change to the baofeng? when I try to upload a small box pops up and tells me it cloning but goes away very quickly,with nothing uploaded to the radio.

Can you tell me what the radio has to set to receive info from the computer? Thanks guy's for your help.

Thanks for the info Jim.
I ordered one yesterday along with a TYT charger base that someone told me would work with the UV-5R. 1 - because I was having trouble with my charger base and NO ONE FROM IMPORT COMMUNICATIONS EVER REPLIED TO MY EMAIL ON WHAT I SHOULD DO because it was new from them as of last Thursday! It came with my new Baofeng UV-5R. Not what I expected from them! And 2 - I was told that the TYT charger base was better to use in a car because of the voltage. The only thing that I have to check when I get it is if the center of the cord is pos. or neg.. I think someone told me that on the Baofeng charger the pos. was on the outside and I think that also was told that on the TYT charger base the center was pos.. Have to check on that. I guess that is the only way that I can charge the battery in my truck.
I also did order the battery eliminator as a just in case. The dash of my truck where my cigaret lighter is is far from me and I may have to add a extension so it can reach me.
Let us know how your cord works out. Thanks.

Date: Wednesday, September 26, 2012, 11:04 PM

Thanks for taking the time to make these measurements. Detailed and easy to understand.

73,

Steve_WB8GRS

The presence of a nice hologram sticker is no guarantee of authenticity.

The counterfiet hologram factory is right next to the counterfeit antenna factory in Shanghai.

Welcome Kurt. We are here to help. May I suggest listening in on local repeater traffic if you are not already doing so. It will help you learn the etiquette. Depending on the software you are using there are ways to disable transmitting. Check the files section.

Hi guys

There's a new version UV-5R Plus available on ebay -

http://www.ebay.com/itm/2013-NEW-BaoFeng-UV-5R-Plus-Dual-Band-136-174-400-480-MHz-FM-Ham-Two-way-Radio-/170906753269?_trksid=p4340.m1850&_trkparms=aid%3D222002%26algo%3DSIC.FIT%26ao%3D1%26asc%3D11%26meid%3D233637466642295207 1%26pid%3D100011%26prg%3D1005%26rk%3D2%26sd%3D170912453326%26

Would appreciate if anyone can share any experience with this model and knows the pros & cons.
Thanx in advance.

I bought my nagoya years back when it was not so popular, but since the uv5r came out I suspect poor copies have been made, I also have an MFJ version which works well.

CHIRP, right?

You have to download from the UV-5R first. This gets you a template specific for the UV-5R. It is this template that you will edit and upload to the UV-5R. Then when you upload you will see Baofeng and UV-5R but they will also be greyed out because you are using a template for that vendor and model.

In regards to the mic jack, I successfully Use an independent mic with the UV5R, that is, that a speaker is not at all required to make the mic fully functional. The Mic circuit uses a floating ground, so simply put you must ground the mic through a separate switch and the ground side of switch is connected directly to a ground on the radio.
Of course the shank on the mic jack must also be connected to this switch so that the radio will transmit. I have used this little circuit for the last few weeks and all my radio contact say the mic works fine.>>>>>KJ6KHF Beaumont Calif.

Jim,
If it is jsut a 12 volt pass thru cable, that will work as long as the engine isn't running. The OEM charger shuts down when the input voltage gets up to around 13.2 volts. If the power cord you are getting has a regulated output between 10 and 12 volts, you should be good with the engine on or off.

I now use the TYT BCG-F8 charger base and it operates fine at 13.8 volts.

New guy responding here.

I had the same issue with Chirp, using the most recent daily build. What worked for me was to download the channel programming from the radio first. Then modify that information, deleting default frequency information and inserting my info. As an early step I saved the download as "original" then saved again as "mychannels". I altered "mychannels" to include the channel programming I wanted and saved again. Now, when I attempted to program the radio the greyed out boxes in the popup now say Baofeng and UV5R. Seems Chirp can't id the radio to upload to but does get that info when downloading and retains that info in the download file.

After that hurdle I have been having a lot of fun with this unbelievably priced and featured radio. I haven't been Ham'in for a long time and actually bought this radio as tool for work (landmobile tech) but now have been back on the bands as a result!

Thanks to this group. There has been allot of information passed here to help a new owner figure out the quirks of this little gem. 50 bucks, unbelieveable!!!

I ordered one yesterday along with a TYT charger base that someone told me would work with the UV-5R. 1 - because I was having trouble with my charger base and NO ONE FROM IMPORT COMMUNICATIONS EVER REPLIED TO MY EMAIL ON WHAT I SHOULD DO because it was new from them as of last Thursday! It came with my new Baofeng UV-5R. Not what I expected from them!

Hey John.
I check my spam folder all the time because spam filters just don't work as good as they should. Nothing in there.
All of this is void now anyway. I ordered the TYT charger base for both home and my truck. I may get one for work too when I order another UV-5R for work. For home, because that charger did not work correctly (as far as I can see) and the truck so I can charge the battery while on the road.
I have a few public service events that I need to use both my mobile and my HT at each event. I found a nice spot where I can Velcro the charger on a pull out cup holder and it is just next to the cigarette lighter :-)

I paid about $13.00 to Radioshop888 for my Nagoya and what came is clearly a real Nagoya antenna -- it's perfectly tuned in the US amateur bands, it has the real Nagoya sticker on its base, and good packaging as opposed to the washy lettering, cheap package, and out of amateur band, tuned at 134-136Mhz of the fake "Diamond" RH-701.

I'd rather pay a reasonable price first and get a good one than take a chance and pay that amount ultimately after getting two or three bad ones or fake ones.

I pay close attention to the pictures -- I've seen Nagoya RA-701's listed but the picture shows a fake Diamond RH-701. I immediately ignored those vendors.

Cheers,
Chris

One more piece of Info- I don't have a 5R handy, but I connected my 3R Plus to a regular 3"X4" 8 Ohm speaker via the 2.5mm plug and it is LOUD- no problem driving a speaker with the 3R. I do not know if the 5R is similar.

Data on my two UV-5Rs.

Number 1

Brand: Baofeng
Type: UV-5R
Color: Red
Delivery Date: June-24-2012 (purchased) / July-1-2012 (received)
Seller: 409Shop ("radiobank" on ebay)
Model: BF-UV5R
S/N: 201204R05546

Electronic information
ON + [3]: BFB231
ON + [6]: 1204171 VER-05

Voice: English voice is "China Girl" (Female voice, English with Chinese accent.)

Remarks: Delivery 8 days from date of purchase ($48.66 USD, free shipping). Supplied by seller with 1800 mah battery. Purchased (red) 3600 mah battery ($26.00 USD, free shipping) from radioshop888. Large battery is perfect fit in both radios. Good audio reports. Using Nagoya NA-701 antenna. Volume control does not turn sound all the way off.

Additional (red) 3600 mah battery purchased from radioshop888 on Sept-4-2012, 1 week delivery. Perfect fit in both radios.

Number 2

Brand: Baofeng
Type: UV-5R
Colour: Black
Delivery Date: August-02-12
Seller: radioshop888 (ebay)
Model: BF-UV-5R
S/N: 201204R25929

Electronic information
ON + [3]: BFB251
ON + [6]: 1204171 VER-05

Voice: English voice is Female with American Accent.

Remarks: Delivered 1 week from date of purchase ($65.00 USD, free shipping). Supplied by seller with 3600 mah battery. 1800 mah not supplied with this radio. Good audio reports. Using Nagoya NA-701 antenna. Volume control can turn sound all the way off.

3600 mah battery is a perfect fit in both radios.

Additional (black) 3600 mah battery purchased ($26.00 USD, free shipping) from radioshop888 on Sept-4-2012, 1 week delivery. Perfect fit in both radios.

No problems with CHIRP or Baofeng software. Read and write to both radios with cheap USB (Prolific or fake chip?)cable from eBay, Win 7 64-bit, 3.2.0.0 driver.

(trimmed)

I don't think this is a quirk unique to CHIRP. I had to do the same a few years ago with the G4HFQ software and my Yaesu FT-2800 and FT-1802.

the impedance on the audio out is probably 16 ohms to feed a typical single ear bud.
However, a speaker mic probably has an 8 ohm driver in it, and those work rather well. If you had a 16 ohm external speaker it might be a tiny bit louder.
or, a pair of 8 ohm speakers in series, but then the load might drag the output down more than a regular 8 ohm speaker would.
this is assuming that the output is 16 ohm...it might well be 8 ohm.
the mic input is probably 600 to 1Kohm impedance.

you should be able to put a mono 2.5M plug into that jack for a speaker and
it should work fine.
If you are really worried, simply use a 2.5M stereo plug, and connect your
speaker leads to the tip and sleeve of the plug and leave the ring
unconnected.

either way, you won't hurt anything. the ring on the 2.5M jack is for tx
data, and grounding that shouldn't alter anything in normal operation.

This pinout works for me on WOuxun, UV-5R, and UV-3R Plus:

3.5mm Plug Programming Pins
Sleeve- Mic - (and PTT) Rx Data
Ring- Mic +
Tip- +V

2.5mm Plug
Sleeve- Speaker - (and PTT) Data GND
Ring Tx Data
Tip- Speaker +

Connect Sleeve to Sleeve for PTT

8975. Transmitting Backlight Duration

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-28 00:47:07 UTC
From: Bob Martin
Topic: 8975 Message: 8975

When bringing up some repeaters, the backlight stays on longer than on others. I never changed its factory setting and in all cases, I hear the repeater in question respond. Shouldn't it be the same for each repeater? Traffic on most of our local repeaters has decreased to the point I have to be satisfied with just giving my ID so don't know if I am actually being heard. Tried listening on another receiver but signal may be suppressing audio from the repeater. Maybe I need to get a friend to follow me from one to another.

in my experience, better to think of the backlight as a random light show more than as something you have much control over. if it's any consolation, my other chinese radio which cost 3x the uv5r keeps the backlight on when scanning, then turns it off if the squelch opens or if you start using the keyboard. some chinese engineer took advantage of the 'hire the dyslexic' act, i'm sure. Hey John.
I just wanted to up date the charger situation.
Today I got home and there was a replacement charger in my mail box. Thanks Ed :-)
This one is actually acting like my other chargers and works very good. I placed my HT in the charger and the LED was red. It changed to Green just a little bit over 3 hours.
I must reiterate that I never got a email so I did not know that he sent a replacement. I'll have to send him a email and say thanks.
I am still going to use the TYT chargers when they come though because from what I have been reading, most say that they are of better quality. Have a good evening.

well, if some repeater hang time/tails are longer, the light will stay on longer I guess.
A good way to check that is, if you can detect colors, change the rx light color to make it different from the stand by color...then you will be able to tell if it is the repeater tail that is longer.
I don't think the display back light timer is channel specific, though I guess I could be wrong.
Either way, you can change the time the light stays on after you receive a signal, in the menus.
It's called ABR I think.

After having this radio for 24 hours, I have to say that I find that it is not worth all the trouble of the purchase. Even after spending a day getting the Baofeng software to work, the software is labor intensive. You can not copy and paste, or import into it. And it does not even move to the next column when pressing the tab key. It takes just as long a time to type in the input and output frequencies as it would programming it by hand.

The Chirp software does not want to work. Which would have made this whole process easier as I could have imported my repeater listing into Chirp. I am beginning to think that the best thing to do with this radio is to give it to your best enemy.

Hi,

Shame you feel that way, it really is a decent radio. I, personally, don't use it with programming software at all, mostly because none of that works with screen reading software, so I'm afraid I'm not very sympathetic to your problems of thinking this radio is as worthless as you appear to. Bet you'd find a lot of takers for it if it's that awful, many of us find it very usable, even without computer software. Sorry you don't.

Eric,

I really appreciate hearing from you and having the news positive was even better. I found it hard to believe that Ed would ignore your needs over such a trival (not in operation) item.

Tonight I checked my Spam and my Bank Balance Notice was in there. I get one everyday and it is always in my Inbox? My e-mail has been screwy this last 8-10 days.

Again, thanks as so often one never hears the results of a problem. I'm sure Ed would appreciate a not also.

Jose, look at it this way. You don't buy this HT because it is the Cadillac of with all the bells and whistles and totally awesome software that virtually programs it for you with little effort.

If you want that you need to invest in a big name brand like Yaesu or Icom or Kenwood and pay several hundred bucks.

Look at it in this light. This is a small lite HT with a L-ion (awesome) and all the functions of a big bucks HT, eg. UHF, VHF, commercial, FRS, GMRS Police, Fire. Id has most of the bells and whistles the big names have like PL ton, the highly coveted Motorola DPL, Deul watch monitor FM radio receive and many more I don't want to type here. and the best part is it costs less than $50.

I see you are an Advanced operator and that mean you been around longer than I have in this hobby and you have the experience to know what ham radio is all about. One big part of Ham radio is preparedness, with Prepping so in and popular today we should all know that hams were the first preppers so the speak back in the day before prepping was cool. Now given that I don't know if you participate in ARES or Races or storm spotting ore any of the shelter ops that many hams assist with but in those situation you may be out in the crap, rain, mud, hail, snow, trash debris, hot, cold every kind of punishment you could think of and do you want to take you Big mane all the bells and whistles and easy to program several hundred dollar HT out in that? I would rather take a disposable HT myself and keep my pretty big buck HT for nice clear field days and ham fests and driving shopping with the wife.

I personally didn't buy the software or USB cable because to me that is cheating. I took about 30 minutes and manually typed everything in by hand. The way I see it I don't carry a laptop around in my back pocket and if I need to add a channel or change some programming I can do it in the field say if I am assisting with search ad rescue or anything like that that I may have to program in a operational freq on the fly. I just think that software is lazy, not putting down all you guys that have it. That is great and I support you 100%, I guess I just choose to do it the old fashioned way.

Just do me a favor and before you chunk it or send it back give the little gem a chance, you might change your mind if you look at it in a different light.

a couple things.
you have to use the latest daily build of chirp, and then you can import your frequency file in .csv format, into chirp and upload it to the radio.
hit the miklor.com/uv5r website that you have been given a few times and read, then read some more. Go to the chirp latest daily build link on that site and get the latest build.
Then install it, and do a download from the uv5r before trying anything else. Once that is done, it should import your freqs and you can upload them.
Don't give up yet.
I would hazard a guess and say that most of the nearly 3000 people subscribed to this very list are happy with their radio and are able to hand program and software program with little difficulty.
I really can't understand why you would say a $50 radio isn't worth it when it just takes a little bit of tinkering to get it to work flawlessly.

I'd love to listen to some local stuff, but havent managed to get anything yet. I'm sure it requres some programming? I honestly have no idea, i'm that new to this. Would definitely like to set it up and listen in, and also pick up some local police and fire.

I did hook up with a club locally, as someone else mentioned. Will be taking a class there soon, looking forward to it.

Is it just a matter of getting the repeater info, and then programming my radio? Sorry for the simple quesitons, i'm starting from nothing. Thanks.

cootos to rob for making this video.
However, he makes it more complicated than it needs to be.
You do not need to preset shift and offset in the menus when you program like this.
the only time you need to set shift or offset is if you are going to be using the radio in frequency mode instead of memory mode.
Also, make sure you set your power level, menu 2, before programming a memory.

here are the steps I personally use to program and it takes me literally 20 seconds or less.

1 insure uv5r is in frequency mode and on the upper display A.
2 insure uv5R is on the correct band either V or U for the frequency you want to program.
3 hit menu, 2, menu and set power to high or low as you require.
4 change step size if needed, though usually I leave it on 5KHZ for VHF.
5 hit menu 13 menu and set tx tone. if needed
6 enter repeater output frequency (such as 147.30)
7 hit menu 27 menu and enter the channel number or select an empty channel with the arrow keys...press confirm on the empty channel and it will speak Receive memory.
wait 5 seconds or hit exit to return to frequency mode.

8 pres (don't hold) scan/rev once and key in the repeater input freq, in this case 147.90
9 hit menu 27 menu and select the same channel as you did for the receive frequency and hit confirm...radio will say transmit memory.

Your all done.

I don't use rx tone so I purposely skipped that step here.
there are things like busy channel lock out and a bunch of other stuff that is channel specific that I don't use so I didn't add them to these 9 easy steps.
each step takes 2 or 3 seconds to perform.
if all your repeaters have the same tx tone, you can leave it set on that tone and you don't have to go back to menu 13 each time.
same with power level.
this thing is as easy as any of the major high $$$ HT's to program memories into.
the difference is mainly that the uv5R treats vfo and memory modes quite different and most amateur HT's and radios use the vfo information to set the memory channels.
Most ht's you set everything up in VFO mode, then just write that to the memory location. In this one, you have to program the memory independant of

the info used for the VFO.
I suspect that is where most of the confusion and frustration comes from.

Date: 2012-09-28 04:14:58 UTC
From: Bob Martin
Topic: 8997 Message: 8997

I have made a bunch of user errors to the point where my wife told me to take a Valum and put the radio away for a while. Every problem I have experienced has been resolved either through a response to my posting, reading link postings, or just starting over. I even sent the radio back to Ed Griffin for evaluation. He found a setting in one of the menus but nothing wrong with the rig. When I got it back today, I thought I still had one of the same problems but discovered what I had and was doing wrong. I have a tendency to pause too long on a button or control. We all know what happens if user holds flashlight button down too long! What I discovered is that I was somewhere between, if that makes sense. My problem was with the FM Radio. The thing is was doing was holding it down, not long enough to activate squelch but long enough to confuse the processor. The trick is a very, very, quick press and let it go. The force of the push was not the problem, it was duration.

In any event, Thanks Ed and many other group members.

This is one of the easiest radios i've ever used, same with software, I am amazed daily by the many problems people have with it, and although I don't know every function, I loaded it with all my local repeaters plus some other stuff, (I am marine licensed also) then I just charge it up and use it, having owned yaesu, icom, kenwood etc, it's easier than some of the big brand names.
My 2 pennies worth.

Ok, so the radio arrived earlier today from 409 Shop. All came in fine condition. I got the usb driver to load successfully after several attempts, but still cannot get either program (Chirp or Baofeng) to recognize the radio. I keep getting the error that the radio doesn't respond. I pushed the plug in as far as it's going to go. Any help from you guys would be greatly appreciated.

Thanks

Just some comments FYI
'Privacy Tones' do not provide privacy. Any listener can hear your conversation as long as they have their Rx Tone set to OFF (as well as if set to your Tone). Also, use of Tone on a simplex channel means you may not hear other users and you may transmit on top of them and cause unwanted interference.

Frank,

You are soooo right. With my Roll up Slim Jim, PVC mast and a battery eliminator, speaker/mic and homemade stand I'm able to run this as a "Mobile Base" in my RV. If there is a repeater within 35 miles I usually can make it and I have gone as far as 65 miles (some white noise) from New Hampshire to Sommers, CT.

When I get to my Winter QTH the Slim Jim will go up in a tree and the "Base" on the sunporch.

I purchased a second unit for my "Toad" and with a little mag (Imp. Comm), Speaker/mic and battery eliminator I can do almost as well. I've got under $200 in a mobile and a base with all of the stuff that goes with them. No one ever asks what I'm talking on or complains of low audio.

Making these semi-permanent may push for a 3rd unit to use as a HT !!

From: Colin McDonald
Topic: 8897 Message: 9016

there is a save button in the file menu, as well as an export button, either one of these will save the contents of the Chirp session that you have open. The save button will only save as a .img file, and the export will allow you to choose .img or .csv.
Once it saves, you can close chirp, reopen it and open that saved file again.
You don't "need" to save before you upload to your radio, but it makes good sence to do so in case something goes sideways in the uploading process.

when you hit save, you should see a field to give the file a name, and where you want to save it, as well as the file extension...
if you have already created a new session in chirp and given it a name, this name will appear in the file name field when you hit save.
after you save, the file name will appear in the chirp window as well.
hope that makes sence and isn't too confusing.

9017. Antenna tuning

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-28 16:29:11 UTC
From: kejones62
Topic: 9017 Message: 9017

Hi, first just want to echo what others have said - this is a great group. I'm a brand new Ham - I just got my license to do some video and maybe APRS stuff with no intention of any phone, but when I saw I could get a radio for $50 I thought I'd give it a try. Still haven't used it a lot, but I was able to get chirp installed on my Win7/64 system with no issues, and programming all the local repeaters was a breeze.

Anyway, I see a lot of plans on the web for homebrew antennae, I think it would be great to build something like a J-pole for when I'm at base. I don't have an SWR meter, though. If I follow a set of plans to the letter can I hook up my UV-5R and have confidence I won't damage anything? Or does it really need to be tuned/checked?

Also, a question about wiring: I'm thinking if I want to build antennae, I should get a female SMA to male BNC adapter, and plan on getting BNC for any antennae I buy or build? Or is there a better standard? Also, what coax do I use?

Thanks - I know some of these questions are non-UV-5R specific, but thought I'd try here.

Kelly

From: John Kintz
Topic: 9017 Message: 9019

Hi Kelly -

First... congratulations on the new ticket!

As to your questions, a basic VHF SWR meter is not very expensive and
you should be able to find used ones easily.

However, as you say, if you follow the directions carefully, you should
not have any issues in building a DIY antenna. Most portable radios are
tolerant of high SWR because they must use such compromised antennas.

Better yet, you can buy a DIY base antenna on the web for not much more
than it would cost you to build. One that I know works well is
available from Ed Fong, an RF engineer and professor (
http://www.ebay.com/itm/Dual-Band-VHF-UHF-Ham-Commercial-MURS-and-GMRS-versions-Base-Stati
on-Antenna-/120985546998
). This antenna comes in an envelope and you install it into a piece of
inexpensive PVC pipe, per included directions. These antennas are
well-known for good performance at inexpensive prices.

Have fun.

You can build antennas if going by every detail and rely on it being accurate, bear in mind you might want to have best vswr for your choice of where in the band you operate most, so if you really don't need voice then look for the area of your countries bandplan as to the center of activity in the mode you choose.
BNC has always been regarded as good quality for vhf/uhf work, as far as coax is concerned, it depends how much distance you want to go, RG58 is ok for short runs, a few metres, but gets lossy at vhf and uhf on longer runs, google for dB loss on the cable per metre/yard, RG8 is better but thinner, and 213 is about the same dB loss but maybe too thick to use if you need to actually hold the radio.
I would only ever used an untested antenna if I had to, even the best built can have faults you didn't notice, a simple poor connection will throw it out, so borrow a meter if at all possible.
SMA BNC adaptors are fine, but remember if you do get a meter you may end up going into so239 sockets so more adaptors needed.
hope this helps,

Subject: [baofeng_uv5r] Antenna tuning

Hi, first just want to echo what others have said - this is a great group. I'm a brand new Ham - I just got my license to do some video and maybe APRS stuff with no intention of any phone, but when I saw I could get a radio for $50 I thought I'd give it a try. Still haven't used it a lot, but I was able to get chirp installed on my Win7/64 system with no issues, and programming all the local repeaters was a breeze.

Anyway, I see a lot of plans on the web for homebrew antennae, I think it would be great to build something like a J-pole for when I'm at base. I don't have an SWR meter, though. If I follow a set of plans to the letter can I hook up my UV-5R and have confidence I won't damage anything? Or does it really need to be tuned/checked?

Also, a question about wiring: I'm thinking if I want to build antennae, I should get a female SMA to male BNC adapter, and plan on getting BNC for any antennae I buy or build? Or is there a better standard? Also, what coax do I use?

Thanks - I know some of these questions are non-UV-5R specific, but thought I'd try here.

Hi,

I also have a question on the left hand scale of the instrument graphs. What does this scale actually represent? It looks strange for a direct SWR scale. Is it loss in db? Reflection coefficient?

If it isn't an SWR scale, can anyone provide a formula to convert to swr?

Thanks, Jimmie

Build one and use it with no fear. You would have to make a horrible antenna to get worse SWR than the antenna that comes with the radio. For a short coax run, I use RG58 and put an SMA-Female to BNC-Female adapter on the radio- then the cable plugs right on the radio.

Hi Kelly,
Welcome and congratulations on your new ticket.

Homebrewing (electronic, not alcoholic) an antenna for VHF/UHF is very doable. It's been done with coat hangers and tape measures. A popular antenna to build is the J-pole because you can find all the parts except the coax connector at the hardware store. Google J-pole and you'll find lots of hits. The key to any of the vertical style antennas is to get them as high as you can. Nearly any external antenna will be better than the stock OEM antenna.

The choice of coax depends on the distance from the shack/radio to the antenna. The simple rule of the thumb is the greater the distance the fatter the coax :) For VHF/UHF I would choose a quality RG8X up to about 50 feet. A lower cost alternative is a high quality RG6 (aka TV coax) which will work also fine. The thicker coax cables (RG213/RG8 style) are somewhat rigid and heavy making them a pain to connect directly to the antenna connection on the HT. Because the UV5R weighs almost nothing "the tail wagging the dog" will have new meaning for you. It's usually easier to have a short length of thinner, more flexible coax to direct connect to the antenna jack on the radio if you've run larger coax to the external antenna. You'll also need to find a SMAJ adapter to connect from the HT antenna jack to whatever coax you choose.

Regarding connector choice there are multiple answers. A generalization is that folks tend to install PL259 (and sometimes N-connectors) on RG8/RG213 style coax and use BNCs on the thinner coaxial cables (RG58/RG8X). Having said that I will also point out that you can find a myriad selection of connectors that will install on almost every cable size. I have a mixture of both BNCs and PL259s in my shack....and adapters to go between them. :) The only SMA connections I have are for my HT antennas. I did use a HT in my truck for awhile and purchased a SMA to SO239 adapter to make that work. It was kind of a kludge to look at but it did work just fine.

If you live in the boonies like me and don't have a local radio shop, you can find all the various antenna/transmission line paraphernalia on the internet. Ping me if you need URLs.

Finally, join a local ham club. You'll find some folks who have both tools (like an antenna analyzer) and experience to help you.

Have fun!

73,
Lew

9030. Is UV-5R UU the newest model?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-28 19:46:59 UTC
From: salamanderjules
Topic: 9030 Message: 9030

Hello all,
I've been looking everywhere I can think to find this out but haven't been able to get a clear idea: Is the UV-5RUU the latest version of the radio despite having the same case as the original UV-5R? Or is the UV-5RA newer? If I understand correctly, the UU has newer firmware than the A.
Thanks for your help!
Sincerely,
Julian

9031. Frequency limitations and Chirp

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-28 19:52:46 UTC
From: Chris Ruhl
Topic: 9031 Message: 9031

Hello, all

I noticed an advanced setting in Chirp whereby one can define upper and lower limits for VHF and UHF. Does this only affect the VFO operation? If so, that would be good so I can't inadvertantly enter a frequency in VFO which is out of the Amateur bands. Does it affect receive operation in channel mode for "monitor only" frequencies outside of those VFO limits?

Thanks!
Chris

My solution to this was to buy a SMA-Female to BNC adapter

http://www.ebay.com/itm/220986845024

and this "pigtail" from Universal Radio:

http://www.universal-radio.com/catalog/hamantht/4512.html

Note this pigtail has 4' of low-loss LMR-100 coax.

These pigtails are only available there in SMA-Male and BNC. I felt the BNC would be more universal.

Chris,
Setting the VHF and UHF limits to the edges of the Amateur bands will keep you from entering VFO frequencies outside of that range with the keypad. You will still be able to program channels with frequencies outside of that range (both RX/TX and RX only) and upload to the UV-5R using CHIRP.

Doing this with the OEM VIP software will allow you to do the same thing plus inhibit use of menu 40 (RESET) or even all of the menus.

Julian,
It's hard to say. There are different version popping up every day. I haven't seen anything to convince me that, beside the firmware updates, the insides are any different between the different models with extra tacked on letters. And from the chart recently posted, even the UV-5R is shipping with BFB291 firmware.

9047. Re: [baofeng_uv5r] Re: new antenna SWR measurements

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-29 00:00:40 UTC
From: Guy Teague
Topic: 8836 Message: 9047

i've having trouble with that. the first antenna (? Puxing_SRH519) looks like it has the lowest swr at m1(138) and at m4(383) and it's not even that good at 383mhz @nearly 3:1. am i reading it correctly?

the 3.79 special seems to be best at m1(145) and m4(418) in the neighborhood of @2:1 at least.

and, if i'm reading these rightly, they are all practically useless at uhf above 440mhz.

i need to find the antenna best for 450mhz and another best at 460mhz. or at least one that is best around 455mhz. i have a bunch of antennas, but no analyzer, alas.

/guy

They do I do and it works great

UV-5RE with 291 revision

I've used Yaesu. Kenwood and Icon and these are brilliant - really pleased with mine

Old Kenwood lead programs it

Will be getting another one shortly

9050. New poll for baofeng_uv5r

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-29 00:08:02 UTC
From: baofeng_uv5r@yahoogroups.com
Topic: 8 Message: 9050

Enter your vote today! A new poll has been created for the
baofeng_uv5r group:

Which operating system is installed on the computer that you normally use to program your UV-5R?

o Windows XP
o Windows Vista
o Windows 7
o Linux
o Mac OS X
o Other

To vote, please visit the following web page:
http://groups.yahoo.com/group/baofeng_uv5r/surveys?id=2755764

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

9051. New poll for baofeng_uv5r

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-29 00:12:48 UTC
From: baofeng_uv5r@yahoogroups.com
Topic: 8 Message: 9051

Enter your vote today! A new poll has been created for the
baofeng_uv5r group:

Which software do you use to program you UV-5R (select all that apply)?

o Baofeng BF5R
o Baofeng BF5R_VIP
o Baofeng BF5R_VIP for BFB291
o CHIRP
o Other

To vote, please visit the following web page:
http://groups.yahoo.com/group/baofeng_uv5r/surveys?id=2755777

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups

9053. Re: [baofeng_uv5r] New poll for baofeng_uv5r

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-29 00:26:49 UTC
From: Guy Teague
Topic: 8 Message: 9053

i use both windows 7(64) running under vmware on mac osx. but now that i have my driver sorted out, i can use chirp on the mac as well. so i needed to be able to select both operating systems since i use whichever one is handiest--both versions of chirp share the same image files.

anyway, i voted mac just to have it represented since i figured the win7 votes would overwhelm it, and to my surprise, it's the leader right now.

I think the recent spate of spam messages to this group have trained a few adaptive spam filters to treat all messages from this group as highly suspect.

Topic: 9031 Message: 9055

Thanks, Jim!

I didn't realize at first that this radio out of the box is completely unlocked and thus potentially dangerous with liabilities of transmitting on unauthorized frequencies. I use it to monitor NOAA and a few railroad road frequencies. I don't recall my Wouxun being this fully unlocked.

I want to be able to demonstrate that I cannot transmit on any unauthorized frequencies, accidentally or otherwise. The flexibility does come in handy because fellow Hams I know want to be able to use the Baofeng for ham use and when they're working on the local tourist shortline railroad with those authorized railroad frequencies. I cautioned them about that because I don't know if that's FCC legal or not.

Guy,
I fought with myself over letting multiple operating systems be chosen but decided to go with just selecting the one is normally used. I went to go change it but there are quite a few votes all ready. The instructions said that if I made any changes the poll would be reset. So I'll leave it be. It will only go for about 2 weeks anyway.

I do. Win 7 Home Premium 64-bit

My cable is a cheap one bought from radioshop888 via eBay. It has the Prolific chip, and I have the 3.2.0.0 version driver.

There is a 5/8 wave mobile dual band Antenna (Tram 1180) available on eBay. This can had for under 20 Bucks+shipping. The only problem is it requires an NMO mount for additional cost, but also can be bought on ebay. I only mention the 5/8 wave antenna, because if your doing so well with a 1/2 wave slim Jim, just imagine the gain and signal increase on a 5/8 wave. >>>>>Frank

Jim,

I appologize that some of this is off 5R subject but may be worthwhile for our users.

I am sure that you are correct as I've seen this very same method used from Church groups to this group and individual e-mails too. What happens is that one way or another they get a hold of your e-mail list and work it, sell it or whatever. Usually suspect e-mails have a simple subject line and usually you know the person it was sent from (because you were on their e-mail list).

You can help stop some of this by using the BCC (Blind Copy) to a bunch of people instead of the usual CC..... keeps your contacts hidden.

The key is to not click on a link if there is no verbiage that you understand to go along with it. Once I got suckered into giving what I thought was Yahoo my signon info for a site I manage.... what a mess!

I never did get any of the $20 million that was hidden in a locked box at the Uwannbago University by the former president's great uncle but I'll keep trying. Hi Hi.

Hello everyone
I'm happy to be a member here.
I've had the uv5r+ for about a week now and I love it.
Is there anything anyone is aware of that's different or unusual with the Plus?
Other than cosmetics of course.

Thanks and I look forward to your responses.

Thanks rob and everyone else.
I don't remember reading that but I am sure not going to do it any more.
Everyone talks about going days without charging. Not me. The longest I
have got was about a day and a half. I think I am going to order some more
batteries as backups and see what amount of time I get from them. All in
all I am really impressed with this HT. Even though my Yaesu VX-7R has a
lot more features, I seem to really like this one better and use it more.
As a matter of face I have not unes my Yaesu sense I have got the UV-5R.
Thanks all for the very good info. I'll have to do some more reading on
this subject when I have a chance.

No simplex is simplex, therefore no repeaters on simplex unless someone set their own up which is very rare,

so to use simplex your transmit and receive frequency would be the same,

where as if it were a repeater your transmit and receive would be 2 different frequencies.

Not sure how clear that will be to understand?

Thank you that makes a lot of sense!

Subject: [baofeng_uv5r] Re: Repeaters

No simplex is simplex, therefore no repeaters on simplex unless someone set their own up which is very rare,

so to use simplex your transmit and receive frequency would be the same,

where as if it were a repeater your transmit and receive would be 2 different frequencies.

Not sure how clear that will be to understand?

9073. Re: Software Issues

I have just received my second UV5r. I have tried CHIRP, the regular Baofeng and the baofeng VIP software with no luck. I still get "Fail connect with transceiver" error. All the software and cable work fine with the older radio (6 months) and 2 different computers-operating systems. I tried a speaker mic and it functions well, so the connectors seem to be good. Not sure what to try next.

RS

simplex is radio to radio, so both radio's are transmitting and receiving on the same frequency.
A repeater takes your transmitted signal, and literally "repeats" it on another frequency.
You set your radio to receive on the repeater output, and you set your radio to transmit on the repeater input.
Simple as that.
follow my 9 easy programming steps that I sent a couple posts ago and you should be good to go.

I can't make heads or tails of the graphs at such a low resolution.

On Fri, Sep 28, 2012 at 7:00 PM, Guy Teague <accts@...> wrote:

i've having trouble with that. the first antenna (?
Puxing_SRH519) looks like it has the lowest swr at m1(138) and at m4(383) and it's not even that good at 383mhz @nearly 3:1. am i reading it correctly?

the 3.79 special seems to be best at m1(145) and m4(418) in the neighborhood of @2:1 at least.
and, if i'm reading these rightly, they are all practically useless at uhf above 440mhz.

i need to find the antenna best for 450mhz and another best at 460mhz. or at least one that is best around 455mhz. i have a bunch of antennas, but no analyzer, alas.

Hi,

I also have a question on the left hand scale of the instrument graphs. What does this scale actually represent? It looks strange for a direct SWR scale. Is it loss in db? Reflection coefficient?

If it isn't an SWR scale, can anyone provide a formula to convert to swr?

Thanks, Jimmie

You were told wrong. You do not need any extra equipment to talk simplex between a UV-5R and an FRS/GMRS HT. Unless one or the other is defective or programmed improperly, they should work.

Group, I finally got the Baofeng software to work consistantly. And I was able to input over 70 repeaters in to memory. The audio sounds good. But I am concerned about my transmit audio and the range the stock antenna has. I sure wish they had used regular sma antenna connectors. Will take radio out with me to field test it tody. Feeling better about the radio. Thanks for all your comments. One learns a lot especially during tough experiences.

Seems that the biggest advantage to having a programming cable is programming alpha tags and blocking transmitting on restricted frequencies you want to listen to.

Just a suggestion for the last one. Manually program the receive frequency like usual, then program the transmit frequency on an FRS channel, set it to low power and pick a CTCSS code that isn't usually used.

If you accidentally hit the PTT button, you might accidentally walk on an FRS conversation but you won't be making the police mad keying on their frequency.

I'll leave the legality of using the Baofeng on FRS out of it. Just weighing risk of transmitting their vs public safety bands.

Much of the low TX audio is due to the mic hole and the expected use of this radio, both of which are covered on the MIKLOR.com site. The radio was intended for noisy environments so one needs to almost put his nose on the screen when talking. We have found doing this usually brings good results.

Happy to hear all else has finally come together.

I would modify this suggestion slightly.

If you have a ham license, you should program the TX to some little used frequency in the 2m or 70cm ham bands. At least you'd be transmitting where you have privileges. 70cm is probably the better choice. Low power and narrow bandwidth would seem to make sense as well.

Maybe I'm wrong, but I don't think setting a CTCSS tone has any merit.

There are actually simplex repeaters but they record some audio and then when you stop transmitting it retransmits your audio so the other person can hear it. Radio Shack used to sell a box for that.

The same type of system is available through the Chinese stores and MFJ has one called a Pocket Repeater. The write indicates "private" so it leads me to believe that there is potential for CTCSS.

9117. Getting Around Memory Of A Different Type Problem

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-29 17:00:24 UTC
From: Bob Martin
Topic: 9117 Message: 9117

Hi!

If I could subtract 10 years from my aging, I wouldn't have this problem but let me explain and then ask the question.

I often can not follow a direct entry sequence all the way through without it timing out so have to start all over. Can't remember much at a time, very slow Braille reader, and read enlarged print a word at a time. When I set up options I need one at a time then stay in Frequency Mode, the repeater on which I am working responds. Is there a way to switch that successful set-up directly into a memory channel? I have so much to learn, and to think, I programmed complicated radios like the ICOM 746Pro with just a hand held magnifier.

This is a very friendly helpful group so I don't believe anyone is going to write back with something like, "If it's too hot in the kitchen, stay out".

Thanks, Group!

Not so common here in UK but there are still odd simplex repeaters we call parrots, they were easier to make than repeaters with offsets at one time. And they do what parrots do, put out exactly what goes in, no split.

Someone is going to read this, then purchase a SMA Male antenna, get it, only to find out they can't use it without an adapter they wouldn't have had to purchase had it not been for your posting.

Look this eBay listing, #160891871582, then read the description. It says it's an SMA F, NOT SMA M as you stated.

Subject: Re: [baofeng_uv5r] Re: Not Worth It

The radio antenna connector is whatever is on the radio. If the center conductor is a pin, then the radio is a Male. If the center is a socket, then the radio is a Female. I think the LCRs and Kenwood Commercial radios started using Male connectors on the radio and confused all the folks who were accustomed to Female radios. The change is good for adapter sales.

Hi Jose,

They are regular SMA connectors. I understand that commercial standard is as on the UV5R, that is, SMA male on the radio, SMA female on the antenna. Personally, I think this is a sturdier arrangement than the ham standard (other direction), but I could be wrong.

Just passed the Tech and General Ham license tests today!

It was something I had wanted to do since I was a teenager (I am 53 now), but never got around to it. I acquired the UV-5R a few weeks ago because it was so cheap, planning to use it only as a dual-band receiver. However, after I got the radio, it motivated me to get my Ham license. After a little bit of preparation online, took the Tech and General exam today and passed. So, in a weird sort of way, this little radio is what made it possible for me to get my ticket. Just wanted to share this with the group.

Bob,
Great question.

Yes, once you have a working repeater configuration in VFO/Frequency Mode it is only a few steps to save it to a channel.

You can only program from the upper display so make sure your working repeater configuration is created in the upper display.

Let's say you are going to store current VFO configuration in memory channel 12 because you know channel 12 is empty. This is the process...

Save the configuration and RX frequency with this sequence of key presses

[MENU][2][7][MENU][0][1][2][MENU]

The HT will say 'receiving memory'

Wait for menu mode to time out or press [EXIT]

Turn on the 'reverse' feature to display the TX frequency by tapping the [*/SCAN] key. It is the second button down on the right of the keypad. You will hear a beep when it is enabled and a different beep when it is turned off.

Save the TX frequency with this sequence of key presses

[MENU][2][7][MENU][0][1][2][MENU]

The HT will say 'transmitting memory'

Wait for menu mode to time out or press [EXIT]

Turn off the 'reverse' feature to display the RX frequency by tapping the [*/SCAN] key.

You should now be able to switch to MR/Channel Mode, select channel 12 and talk on the repeater.

Good luck,
Jim KC9HI

> I often can not follow a direct entry sequence all the way through without it timing out so have to start all over. Can't remember much at a time, very slow Braille reader, and

read enlarged print a word at a time. When I set up options I need one at a time then stay in Frequency Mode, the repeater on which I am working responds. Is there a way to switch that successful set-up directly into a memory channel? I have so much to learn, and to think, I programmed complicated radios like the ICOM 746Pro with just a hand held magnifier.

it is just a metal faceplate that only covers the top third of the front of the radio.
And it appears to be laser etched.
The remainder of the case is hard plastic.

Topic: 9017 Message: 9132

I second the recommendation re Ed Fong's J-Pole antenna. I purchased one and installed it per instructions in a 5 ft. piece of 3/4 in. low pressure (thin wall) PVC -- the purchase price for a 10 ft. piece at Lowe's Home Improvement was $2.07 -- and used the other 5 ft. of PVC to fashion a mount to install the antenna on the side of my house near the roof peak. I also purchased 18 ft. of LMR400 low-loss coax. 'jumper' cable w/PL259 (male) connectors and a 3 ft. "HT saver" jumper w/SMA female (for HT) to SO259 (female) connectors.

I can now hit a nearby UHF repeater that I couldn't previously hit due to topography and thick foliage.

I don't understand your concern. I said if the radio has a center conductor that is a pin, then the RADIO is a MALE. If the RADIO is a MALE, then logic says the ANTENNA must be a FEMALE.
The antenna in your listing is indeed a Female Antenna which is correct for Male radios like the UV-5R, UV-3R Plus and Wouxun.

excellent stuff.
get as close to the mic hole as you can. It's the way all of these LCR's are designed and it's a firmware setting, so there isn't any convenient pot or something that you can crank up.
I get great audio reports, and listen to others using the UV5R on a daily bases, and as long as they are slapping their lips on the mic hole, their audio is quite good hi.
The stock antenna is not the greatest you are right, but there are some really very good antennas availible on ebay, such as the j0125a for around $3.79 to 4 bucks...as well as quite a number of other antennas.
Just make sure the antenna is an SMA female, and you'll be good to go.
The nagoya 701, nagoya na771 and the j0125 are all good antennas for the cost.

I think it's great for the price. especially for us who can't afford a 400 dollar HT. Fifty bucks and it works! At that price you'd expect to have to put a little work into it. One thing I don't think anyone has mentioned is that you can save your programming to a file in the software and send the file via email to friends! I had problems getting the software to read the radio but the fix was a more updated ver. of the software. With that in mind I still think it's a great little radio for the price. I hope you see a positive my friend.

The Baifeng UV-5r Antenna mount is a male so you have to get an antenna that is a female to match the Baofeng. To have a match you have to have a male and a female not 2 males or 2 females.

Newbie here getting confused on antenna options.

I can see the UV-5R is has the male pin and outside threads. Would it make sense to keep solidly threaded female adapter on the radio to protect from pin damage?

It seems to me I can replace an antenna easier than the radio.

If my assumption is true, then I'm confused as to which adapter I'd look for. BNC male to SMA female or BNC female to SMA male?

Did I mention I was a newbie 8-)

Sure, EXCEPT that adding the adapter adds a lot of stress to the antenna socket and makes it more likely that you will snap the antenna jack off the circuit board inside the radio.

Antennas are made to be flexible and frangible so that they get damaged and not the radio.

You pays your money, you make your choice.

Note that not all SMA antennas are made the same. Motorola radios use an SMA connector with the hole on the female flush with the edge of the outer barrel, and a more recessed, thinner and shorter pin.

So putting a UV-5R antenna on a Motorola radio can leave you with no antenna connected although it is screwed in all the way and vice versa, a Motorola antenna (or one designed to replace one) may damage the pin in the radio.

Look in the archives for antenna discussions and stick with the ones people say are good.

> If my assumption is true, then I'm confused as to which adapter I'd look
> for. BNC male to SMA female or BNC female to SMA male?

You want an SMA female (chinese radio style) on one end and BNC female on the other. Yes, the things that stick out of the radios are female.

Geoff.

Regarding worries about the radio connector- I have been using a Wouxun daily for the past 2 1/2 years. In the charger I use an SMA to Bnc adapter and connect to a rooftop antenna. When I take it to work, I unscrew the adapter and screw on an antenna. This is just about daily and I have had no connector problems.

Regarding the adapter, lets think this through--- The radio has a center pin so the radio is SMA Male. If you have a normal BNC cable, it will have a connector with a pin also, so it is a BNC Male. To adapt them we need an SMA-Female to BNC-Female adapter like this one:
http://www.ebay.com/itm/Gold-SMA-female-to-BNC-for-KG-UVD1P-KG689-PX-888K-KG679-FD288-UV-5R-FD289-TG-UV2-/180982604327?pt=US_Radio_Comm_Coaxial_Cables_Connectors&hash=item2a23676227
Just remember the center contact is the sex and opposite sex connects.
Hope that helps.

The pin of the antenna connector is recessed into the radio/connector body
to the point of being nearly flush with the top of the connector. You'd
have to work at bending it. If you're going to replace the OEM antenna
take a hacksaw to the last inch of the antenna and voila', an antenna
connector protector(TM) ;)

A double female SMA would probably do the "protection" job as well and
should also allow you to mount a SMA male antenna. There'll probably be
some threads showing but a small rubber washer from the hardware store
would probably take care of that.

I purchased a SMA female to BNC female adapter to let me attach a short
coax jumper to my RG213 going to the outdoor J-pole. There *is* a small
gap where the adapter connects to the UV5R's antenna jack but I haven't had
a chance to get to the hardware store yet.

Gary,

My first guess would be that you programmed a R-CTCS or R-DCS by accident. Program the channel again and make sure menu 10 and menu 11 are set to off. That is if you programmed the channel via the keypad.

If you programmed with software, make sure your are not enabling any kind (CTCSS or DCS) squelch.

9149. Re: [baofeng_uv5r] Unable to receive packet / APRS with UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-29 21:36:06 UTC
From: Lew Paceley
Topic: 8333 Message: 9149

A low cost way to check your UV5R's receiver for proper APRS receive would be to wire up a 2.5mm plug to the radio's speaker output and then cable it to your laptop/desktop mic/line in. You can download UZ7HO's soundmodem software for free. The soundmodem software has a built-in packet monitor so you can see what's going on. Just click the icon on the task bar.

You'll probably have to play with the radio audio level out and computer audio input level to ensure good decode.

With the computer performing the DSP decode functions no external TNC is required. I use UZ7HO's software regularly with UI-VIew/APRS on my ancient Kenwood 711A and it works great.

not really necessary.
if you are concerned, simply keep the stock antenna on the radio while not in use.
If you are worried about dust and so on getting into the connecter during transportation when you have to take the antenna off, a piece of electrical tape over the antenna socket will prevent that.
putting any sort of adapter on the UV5R's antenna jack will stress it more so than no adapter...
The male SMA design is far more robust on the radio compared to the female SMA radio connecter...with the female sma on the radio, it sticks out and has a far higher potential for snapping off...with the male on the radio, the antenna's female sma is more likely to snap before you break the center pin on the radio itself.
The outer threaded shell of the Male socket on the radio will take allot of the side to side stress and protect the center pin.
Also, with a female SMA on the radio itself, that center hole will ware out after many repeated uses where you are putting HT antennas on and taking them off...with the male on the radio, that pin will wear out the antennas center and not the radio's connecter.
Easier to replace an antenna than a radio in every situation :)

Hi all,

Just got a brand new 5R, and after the first download of frequencies from the pc (baofeng software), it now seems as though the squelch is jammed open, as if the "MONI" key is held in.

Full resets have done nothing. Any suggestions on how to fix this?

thanks
Rob

Rob,

I suspect that you have the BFB291 firmware and are using the VIP software for BFB291. I don't have anything with BFB291 so the best I can do is to suggest some thing to try.

What is the setting of menu 0 (SQL)? If you've done a reset, it should be set to 3 but let's make sure it isn't 0.

I assume the squelch setting has nothing to do with it so let's try something else...

If you haven't already, save you channel setup to a file. Now go through the software menus and set them all to their defaults and upload them to the UV-5R.

Does the MONI button still work? If it does. you should be able to turn on and off the flashlight.

I don't know how it would affect squelch, but you might plug and unplug the programming cable or a speaker/mic a few times. Some new radios have have flaky contacts in the jacks and using them sometimes gets them to behave.

That's all I can think of for now.

Good luck,
Jim KC9HI

you guys were smart--you waited out the code requirement! i barely passed @13wpm and never could get to the 18 needed to take extra. even the navy dropped the cw requirement a few years after i graduated radio school and it showed. during a nato operation in the mediterranean the europeans had a cw net and out of about 125 radiomen on the carrier, only 3 of us could copy enough to sit the circuit.

oh well, change with the times or die with the times say i. welcome to the 'club'--better late than never. hope you get a good call, the one i got for my conditional license (later upgraded to general) was so awkward i went back and got an advanced license just so i'd have the option to get a new callsign. luckily this time i got one i liked so much i don't even need to fight the dogpile that is the vanity pool.

well m8 to me those outputs are the receive frequencies and those pl=107.2 is the tone that's required for that repeater to activate and transmit your audio, but you should have a input and output freq as well as the tone. EG: below.

Input=???????? Output=444.950 + PL=107.2

Input=???????? Output=145.170 - PL=151.4

> wouldn't they?

Depends on where you put it. My first test on top of my building, a 6 six story not so flat, was with an FRS radio. It got about 5 miles with a standard FRS. The guy I contacted was a long winder and couldn't take the 30 second limit! It sure messed with a few kids in the 'hood that didn't understand the concept!

This audio issue? could we just make the mik hole a bit bigger? would there be anything to gain by doing so? my way of thinking would allow more noise on the mike?

M8 if you want to protect the pin in the radio antenna socket i would probably use a sma female to male adapter if there is 1? as your radio has the male socket.

reming out the mic hole does improve the loudness and overall frequency
response slightly.

As has been documented on the miklor website, check your units mic opening
for glue or plastic that might be partially blocking the opening.
If there is none, like on mine, you can drill out the hole to at least
double it's size to improve things a little.
again, documented on the miklor.com/uv5r website.
For what it's worth, a friend of mine did drill out his uv5R mic hole and
there was hardly any real difference in the loudness of his audio, but the
pops and clicks came through far better lol.

I wonder if using an external condenser type microphone, or an amplified
microphone improves the audio loudness, or just distorts it. The gain is
set in the firmware, so I suspect running a really hot external mic wouldn't
increase the overall loudness of the audio.
There is +voltage on the mic jack on the radio, so building up something
using a cheap 3V condenser element might be a fun project.

Congratulations Don, and welcome to both this group and Ham radio. I won my radio last week at the University of Nevada Reno breakfast club meeting. I just happened to drop in as my wife's sister lives in Reno(On vacation from Hannibal Missouri). Never went near a Slot or gaming table and still came home a winner.

hello

I received my new replacement Baofeng today to replace the one that went bad. The dealer sent me a new one This one will NOT accept anything from the computer. The old one that has a bad receiver still accepts the computer just fine.

Any ideas??

Thank you

Steve

9184. Programing Cable on a Mac !

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-09-30 03:46:49 UTC
From: w2eec
Topic: 9184 Message: 9184

Hey all.
I am very happy today! :-) :D
My DB9 programing cable came today from Import Communications in only a few days to upstate New York. I added it to my Keyspan USA-19HS DB9 to serial converter cable and started the newest daily build of Chirp. Bang, Pow, Boom! It was reading my Baofeng UV-5R. Then I did the same to my UV-3R. Worked perfectly! I am going to order other DB9 programing cables for all of my other rigs so I can now program all my equipment in the Mac OSX environment. This is so, so, nice. Up to this point I have had to purchase Windows and create a VM in Parallels for Mac and then program from there. A lot of extra effort if you ask me but at the time it was worth it. Now I can't think of anything else that I need to boot in to Windows for. I may keep the VM but I could free up a lot of space. I'll have to see.
Anyhow I have tried several USB programing cables with no success. Many have offered there time to help and still nothing. The cables may be bad or the drivers just didn't work for some reason or a combo of the both. Why it didn't work I don't know but this Keyspan USB to DB9 cable has always worked so I am going to stick with it. Worth the money I paid years ago.
Anyhow, if any Mac user out there is having troubles getting the USB programing cables to work. May I suggest this Keyspan USA-19HS USB to DB9 serial cable along with the DB9 programing cable for whatever HT or rig you are using.
Once again, thanks to everyone that helped me out. It is very much appreciated.
I have to mention that I think Chirp is a very nice piece of software too.
I love the fact that I can put in some of the local FD frequencies and make it so there is no possible way to be able to transmit.
I hope Chirp is going to support the new Any Tone mobile rig when it comes out.
Have a good weekend all.

Mark,

I have the three files required to run the BF-291 software if you would like them e-mailed. They are all unzipped so it would be easier to work with perhaps?

Also please not that at least your programming cable needs to be plugged in to your computer, with the correct comm port set in order for the software to even load up.

Let me know.

Eric,

Perhaps you could put your solution detail in a form that can be used on the miklor.com site as it looks like you have cracked a nut for our Mac users.

Check the settings in Device Manager. Select driver info and manually select the driver from the list of available drivers. Do not use Microsoft one use Prolific 3200, if you don't have it google and install.
Once the driver is selected and you select Com3 everything will work fine. First try reading from the radio then you will know it's working.

Ive owned my UV-5R for over a month now & within the 1st week of ownership the monitor/flashlight button stopped working. I can press it once & the flashlight wont come on, and i can press & hold it down for the squelch to open up & still nothing happens. Im curious to know if anyone else has had this issue with theirs & how they fixed the problem? Im still happy with it cuz that 1 lil problem isnt enough to break me from sending it back but if it can be rectified then i'll see what i can do about it.

Jose,

When you enter the info in one column hit ENTER and it will go to the next column.
The software is pretty basic but it does work. Unfortunately with Win7 the driver is a hassle but using the Prolific 3200 driver it works great. Have to be careful not to accept Windows update Prolific driver it will screw things up and you have to roll back to the 3200 driver.
Once I got the driver to work the programming was a cinch had the radio programmed and running in less than 10 minutes.

Don't give up so quick, for the money it's okay, not the best radio in the world but what do you expect for 50 bucks

Harri

> After having this radio for 24 hours, I have to say that I find that it is not worth all the trouble of the purchase. Even after spending a day getting the Baofeng software to work, the software is labor intensive. You can not copy and paste, or import into it. And it does not even move to the next column when pressing the tab key. It takes just as long a time to type in the input and output frequencies as it would programming it by hand.
>
> The Chirp software does not want to work. Which would have made this whole process easier as I could have imported my repeater listing into Chirp. I am beginning to think that the best thing to do with this radio is to give it to your best enemy.

Just enter the same frequency for both TX/RX ie. 146.520 in both and it's the same as simplex.

When you plug in you USB programming cable the first time after installing the correct drivers, Windows will assign it the next available COM port. You will have to look at device manager or use FindComPort.exe to find the COM port that was assigned. You cannot count on it being COM3.

Most cables coming from an antenna that are terminated with a BNC connector are male. So the adapter required would be an SMA female to BNC female. I got mine really cheap on eBay. Radio Shack has what I would call an "HT saver" with the above connectors and 1.64-Ft (.5M) of RG-316 coax but it is nearly $20.

Where are you getting the AAA cases? I found 2 vendors in a google search - one (aliexpress) no longer carries it and the other (happyhamshop) doesn't carry it on his ebay store (seems odd).

I'd like to get one but I want to order from someone that actually has it.

99.99% of all BNC cables are BNC male, so I use a SMA
female to BNC FEMALE. Just ordered 2 more in face.

Hey William.
Nice call sign :-)
They are from "happyhamshop" auction # 170911587852.
It states more than 10 available - 19 sold. They are $13.99 each with free shipping.
I can't wait to try them out. I think they are nice to have as a back up. In a worse case situation you almost always can get AAA batteries at your local corner store.
As someone stated that they would like to have seen AA battery cases but looking at the setup and how many batteries have to be used, there isn't enough space keeping the same form factor. Let us know when/if you get them how you like them. I'll post my updates too.
I'm chomping at the bit to see if rechargeable AAA batteries work with this HT and fit the case that I purchased. Recyclable batteries run just a bit thicker than standard alcaline batteries. It would be very nice for me because I have a lot of recyclable batteries that I can use at hand. Happy shopping.

The upper portion of the battery case will click into position but the bottom will not engage the retaining tabs on the lower part Of the radio housing. I've contacted the seller and he assures me it is the correct case made for the UV5R and it does look to be. I believe a saw a post here a while back where someone else had the same issue . Has anyone else purchased on of these AAA battery cases for their UV5R's? What is your experience hitch them?

After reading through the thread, it looks like two issues were experienced, is this correct?

1) chirp/baofeng software does not recognize the radio
2) vip software gets .ocx error

What worked for me in either case was:
1) make sure prolific 3.2.0.0 drivers are being used for the com port (no yellow ! in device manager), select the correct com port in the software, make sure cable is seated into the radio all the way.

NOTE: I had to shave most of the top and side of the radio side connector on the CABLE to get it to seat into the radio all the way. it is very soft and very quick to try:

with the cable plugged into the radio, and the radio standing up, look at how the cable is oriented for top/bottom, and how one side of the connector on the cable is really tight against the radio. take a knife and shave the top (wire to usb side) and right side of the connector as close to the metal prongs as possible. i had to cut a 4-5mm deep "wedge", and a chunk off the "top" of my cable's connector to get it to seat all the way. without cutting the wedge it would NOT seat all the way, and would NOT work with the software.

2) Make sure you have the baofeng software installed correctly. the error you are getting when running the VIP software says the .ocx from the original software is not installed, or in a location that can be found. I belive you may also need to run the VIP software in compatibility mode (right click the .exe> properties> compatibility> run as windows xp service pack2.

> Ok, so the radio arrived earlier today from 409 Shop. All came in fine condition. I got the usb driver to load successfully after several attempts, but still cannot get either program (Chirp or Baofeng) to recognize the radio. I keep getting the error that the radio doesn't respond. I pushed the plug in as far as it's going to go. Any help from you guys would be greatly appreciated.

Hi
Just had a look at happyhamshop seems to be sold out of the cases
I Have however found a vendor selling complete batteries very reasonable priced it is radioshop888 Item number: 370643779426
May Be Worth Knowing....
